The Banner mine, I am told, never looked better; large masses of ore in sight, and the company now talk of putting in ten stamps more, which will increase the number to fifty, which you will perceive is no sardine, although it does not assume that shape now. The amount of rock coming out of the mine at present is more than sufficient to keep even sixty stamps running, much less forty; hence the talk for ten additional. The engine purchased of Booth & Co., of your city, is a splendid affair, and goes far to their credit for engine building. We have four rockers at work on sulphurets, and one buddle, and have contracted for building another. The thing, taking all in all, moves along finely, and in a short time we will be right side up with care.

VIVIPAROUS PERCH—FISH BORN ALIVE. *Harper's Magazine* asserts that the report of viviparous fish in the waters of California, "which, for a time, so seriously disturbed the learned savans of the French Academy," is without foundation. The writer of the article succeeds in proving his ignorance, and that is all. These viviparous fish are abundant, and that they give birth to fish and do not deposit eggs like most fishes, is evident to most persons who have cleaned many of the perches sold in our markets. They have ceased here to be a curiosity. The little perches, previous to birth, are well formed, and when they commence their independent existence they are several inches long.—*Alta.*

METALLURGY IN CALAVERAS.—The new Hagan furnace at Angel's has been running for ten days, and some of the roasted rock has been sent to this city and examined. The sulphur has all been driven off, and, so far as an opinion can be formed from the specimens received here, the success is complete in roasting. The Bentou mills are at work with two Ryerson amalgamators and twenty stamps are crushing for reduction in the ordinary way. The Ryerson process extracts about $25 a ton from the Josephine rock; the amount by the common process we have not heard.—*Alta.*

THE ELLERSHAUSEN IRON PROCESS.—It is said that the Ellershausen process of making wrought iron, recently inveuted and tried on a large scale with success at Pittsburg, will reduce the cost of the metal at least $10, and perhaps $30 per ton. The process is very simple; the molten iron as it runs from the smelting furnace is mixed on a revolving wheel with pulverized ore, and after it cools it will not melt when heated to white heat, but has the qualities of wrought iron, and is ready for the forge.

LARGE SHIPMENT OF CALIFORNIA BRANDY. A part of the cargo of the ship *Escort*, now loading at Vallejo street wharf for New York, is a shipment of three hundred barrels of Calistoga brandy (amounting to twelve thousand gallons), from the Calistoga distillery on Mr. S. Brannan's estate in Napa Valley. On the 16th instant, another lot of one hundred and fifty barrels will be shipped—the product of the same distillery, which is the largest in California.

ACCORDING to Professor Poey, the temperature of the sea always diminishes as we approach land, or shallow water, thus serving as a guide to the navigator when other means of information are not at hand.

PROF. PERREY'S EARTHQUAKE NOTES.—M. Perrey, Professor at Dijon, in France, is considered by many as the best authority on the subject of earthquakes. He has collected a large amount of information on this subject. The foreign consuls of the French Government in every part of the globe have been instructed to furnish him with observations and with the literature of earthquakes, and circulars were sent, through the agents of geographical societies, to all travelers, asking for statistics and information; and thus in the course of a few years M. Perrey has accumulated the record of more than 7,000 earthquakes, which he has tabulated, and upon which he has attempted to found a theory of their origin, which, however, has been stoutly opposed by geologists. It appears from his observations that these convulsions occur more frequently during the winter half of the year than during the summer; that there is a preponderance of shocks at the equinoxes and the summer solstice. A variation in the pressure of the atmosphere is found to have some connection with the phenomenon, as the earthquake action is greatest when the barometer indicates that the weight of the atmosphere is the least, and the pressure variable. The nature of the earthquake shock is that of waves propelled from a central point. These waves are as variable as those of the sea. They are sometimes only an inch or two in hight, and at other times several feet high. Sometimes they cross each other and produce a rotary motion, which is very destructive. The geographical formation of the region disturbed has much to do with the velocity of the earthquake, as through certain strata the shock is propelled faster than in others. On land the velocity of the wave is found to vary from 40 to 140 miles a minute. In the ocean the earthquake wave is found to move at the rate of eight or ten miles a minute.

MAP PRINTING ENCOURAGED.—In Prussia there is a Government map printing establishment, in which the work of publishing the most recent geographical charts is performed at the lowest prices, for the benefit of the public. Not only are the schools supplied with the best maps, but a prize of comparatively easy attainment consists of a world-map, so that by this means the dwellings of the majority of the people may be supplied with these excellent instructors.

THE SOUTHERN HEAVENS.—In the southern heavens there is a region of the sky in which stars of all magnitudes are strewn more richly than in any other portion of the celestial sphere. The general blaze from this portion of the sky,—says Captain Jacob,—is such as to render a person immediately aware of its having risen above the horizon, though he should not be at the time looking at the heavens, by the increase of general illumination of the atmosphere, resembling the effect of the young moon."

SONORA PACIFIC RAILROAD.—Information has been received,—says a Washington correspondent,—that the Texas Convention has passed an ordinance giving the right of way to the International Pacific Railroad, from the eastern to the western border of that State, and a reservation of twenty miles on each side of the road, the road to be completed within six years. This road is one of the connecting links of the international line from Cairo to Altata, on the Gulf of California.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their solu ble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luuchcon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adopting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London. 6v18-1y

Mining Secretary.
THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.
Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

[ADVERTISEMENT.]

Reduction of Ores.

MESSRS. EDITORS: As White Pine and adjoining mining districts are now attracting much attention, allow me to say a few words in regard to our mines, and the best method of extracting their minerals. What little knowledge I claim is chiefly of a practical nature, derived from some twenty years' experience in the mines of California and the silver districts of Nevada.

To commence with the Comstock lode, the usual and best known process is to roast the ores in the German reverheratory furnace—a mode of treatment adapted to only a certain class of rich ores, and exceedingly expensive, not only in the original outlay for machinery and furnaces, but also in reduction; in fact, too expensive for ores running lower than from $30 to $40 per ton, the actual cost of working, after being delivered at the mill, being about $30 per ton. In addition to this, the bullion, when obtained by this process, is only about 500 fine, when it should be 900.

The question then arises, how are the lower grades of ores to be worked?

Can the result be attained hy the smelting process? Both science and practice, so far as this coast is concerned, answer in the negative. This mode, as a general rule, has proved a failure. Such has it been in my own experience. Few mines have the requisite amount of galena for a proper flux. The great cost of fuel is often an insurmountable objection. The variety and different combinations of minerals so frequently found render this mode of working in most instances utterly impracticable. In all my experience I do not know of a single case where smelting works have proved remunerative, or even successful, so far as the reduction of the ores was concerned. Whether the Hagan Furnace, though not designed for smelting, recently introduced and not yet fully tested, will prove any more successful, remains to be determined.

It seems to me, therefore, after a survey of the whole ground, that the only feasible plan for cheap and profitable working of the lower grades, as well as of many of the more rebellious higher class ores, is the more general adoption of the pans now used in our mills with some modifications, which I will state hereafter. It is to this source we are to look for rapid strides in the next few years, in the opening of many mines which are now unproductive. A brief account of the introduction of the process, together with some of the advances made in this mode of working, may not be amiss in this connection.

On the discovery of the Comstock lode, it was but in its infancy. The Bartola pan, the first introduced—diameter 30 inches, with a capacity of 50 lbs.—was too small and too slow for any practical use.

The Smith pan, built soon after, 4 feet in diameter, proved to be a decided improvement on the former, but was rather slow for the fast days of Washoe.

The Knox pan, of the same diameter as the last, was the next in order, did its work well, but was objectionable on the ground of slowness and the consequent cost of working.

Next followed the Wheeler pan, diameter also 4 feet, a fast runner, very popular at that time, and making an entire revolution throughout the whole coast from Idaho to Mexico.

About the same time appeared the Varney pan, the Hepburn & Peterson, the Wheeler & Randall, and a number of others of greater or less merit, which for want of space we are compelled to dispatch in a line. The next step in advance was the Wheeler *improved* flat-bottom pan, much better in my opinion than the conical bottom, and destined to supersede all others in use.

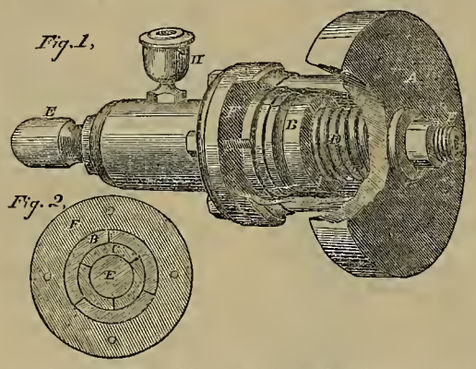
It is a fast pan, of five different sizes, working in the largest as much as one ton at a charge in four hours. It is the invention of Mr. J. H. Stewart, a practical miner and mechanic. Having run all the pans in use, and seeing their defects, he was led to get up the one which now bears his name, and which he believes is far superior to any other hitherto introduced. The principal improvement claimed for it consists in a galvanic pan or battery in the pan, generating its own electricity at a cost of only two cents per ton. They are believed to be the best for the White Pine ores, where eight of them have already gone, being best adapted to dry crushing, which mode will save a much larger per cent. of the mineral from this region than the wet.

This pan has a false steam bottom, so that the ore or pulp becomes very hot without getting too wet. The pulp is worked thick. When chemicals are to be employed, which can only be determined by experiment, some kind of an alkali, such as cyanuret of potassa, with a little sal ammoniac, is the best in my experience, and to be used with caution. The White Pine ores are generally easily worked, seldom requiring chemicals of any kind.

Any information in regard to these pans, or the new galvanic process, can be had by addressing Mr. J. H. Stewart, care of the Miners' Foundry, San Francisco, or calling upon him at the office of the same.

PRACTICAL MINER.

COLLIER & SILLIMAN'S
METALLIC PRESSURE PISTON ROD PACKING.



This invention relates to the packing used to render piston rods or propeller shafts steam and water tight, and has for its object the construction of a metallic packing, which shall be operated upon by gas, the vapor or liquid exerting the pressure, in such a manner as to form a perfectly tight joint. It also consists in so forming the gland of the stuffing box, that it shall serve as a support and guide for the rod and shaft, and at the same time afford great facility for lubrication.

Two small openings now connect the interior of the cage with the source of pressure—as the cylinder in an engine or pump, or the water outside of the ship if it is for a propeller shaft—so that the greater the pressure the closer are the rings forced against the rod and inner face of the gland. In any case the Packing is to be applied to a water or air pump, so that the pressure will come from the liquid or the gaseous substance, as the case may be. One of the most important uses of this Packing is in the stuffing boxes of propeller shafts, in which case the openings connect with the outside water, the pressure on the rings depending upon the depth to which the shaft is submerged. This device is simple, and not easily got out of repair; is perfectly efficacious and self-regulating, and in the case of shafts, especially, will do away with the great expense of repairing the derangements of the stuffing box which now so frequently occur. This new invention has already been adopted on the Central Pacific Railroad and by some of the principal Flouring Mills in San Francisco and Sacramento, and is growing at once into popular favor. A description of the engraving accompanying this will be found in the *Mining and Scientific Press* Jan. 9, 1869, and in the patentees' circular, which can be had free on application.

Certificates of Recommendation:

OFFICE C. P. R. R. CO. OF CAL., Sacramento, Nov. 24, 1868.—*To Whom it may Concern:*—This Company has made a thorough practical test of Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and accordingly recommend it to all others interested.
E. B. CROCKER, Gen. Agent C. P. R. R. Co.

THIS IS TO CERTIFY, that we have been using the Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and would recommend it to all others interested.
SETH H. GARFIELD, Prop. Pioneer Mills, Sac. City; WM. ETCHELLS, Engineer.

For sale at the principal Machine shops and Foundries in San Francisco. Full particulars can be obtained by addressing ORRIN COLLIER, Sacramento, Cal., or E. B. SILLIMAN, Bridgeport, Ct.

3v18-3m1am

KEEPING MINERS UNDER LOCK AND KEY. A Virginia City telegram says:

The miners in the Imperial shaft at Gold are still kept under lock and key, and nothing concerning recent developments in the mine has been made public.

It is not quite clear to us whether stockholders are included with the unfortunate public or not, in cases of this kind,—which appear to be considered quite regular at Virginia City and becoming more frequent.

THE Brazilian Pebble Spectacles are believed to be the best for the eyes. They can be had at Muller's emporium, 205 Russ Block. *

A Practical Guide for Puddling Iron
and Steel.—By Ed. Urbin, Engr. of Arts and Manuf. A Prize Essay read before the Association of Engrs. Graduates of the School of Mines, of Liege, Belgium, 1865-6. To which is added a Comparison of the Resisting Properties of Iron and Steel, by A. Brull. From the French, by A. A. Fesquet, Chemist and Engineer. 8vo., cloth..... ..... $1 00

☞ The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address. 20v16tf

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. M. S. S. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR FEBRUARY, 1869.

The following Steamships will be dispatched on dates as given below:

February 6th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with ALASKA, Capt Gray.
February 13th—COLORADO.....Capt. Wm. H. Parker, Connecting with RISING STAR, Capt. King.
February 22d—SACRAMENTO.....Capt. A. West, Connecting with HENRY CHAUNCEY, Capt. Dismor.
February 27th—MONTANA.....Capt Wm. H. Hudson Connecting with ARIZONA, Capt Marry.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports. Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN, Captain George E. Lane, will be dispatched on THURSDAY, February 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco

FROM IDAHO.—Our correspondent from Boiso City, under date of February 4th, writes:

The Monarch Company, Mr. Atkins, Superintendent, at Yuba, Alturas County, I. T., have just cleaned up their first run of six tons of Atlanta ore, and have as the result, 1,200 pounds of dry amalgam, of about $500 to the ton,—as it is silver, with a small percentage of gold only.

The Leonora I wrote about before; it produced $6,060, valuing which at $13.50 per ounce, the assaying rate, from 130 tons; only about half the gold and no silver being saved.

We do not want any White Pine for either Owyhee or Alturas counties, both of which are superior to White Pine in many respects. Water is free,—instead of twenty-five cents a gallon,—and in Alturas lumber is $60 a thousand, and enough for a century; provisions plenty and cheap; flour, $15 per cwt., etc. The good time for Alturas County is coming, and capitalists can see for themselves, for all we want in Yuba is capital. OBSERVER.

HAWAII, THE ISLAND OF THE GREAT VOLCANO, SINKING.—During recent earthquakes it is asserted that Hawaii, the largest island of the Sandwich group, embracing 4,000 square miles, settled upon its foundation a few feet on the southern and western shores, a few inches only on the east and north, but enough to cover the old tide-marks, and to overflow the vegetation of the more level beaches. The island is entirely volcanic, and was formerly at least partially under the ocean—a fact established by the marine shells distributed over its surface, at considerable altitudes. Accurate and reliable data with regard to the present alleged submergence have not yet reached us.

NEVADA CITY FOUNDRY.—Under the active supervision of the energetic proprietor, John McCone, the Nevada Foundry, Silver City, continues daily to turn out an immense amount of work. The number of workmen at present employed is 105, and the average amount of castings turned out per day is 14,000 pounds. They have just cast a mortar for the Bay State Mill, which weighs 4,500 pounds, showing that they are prepared to do heavy as well as light work. They are getting up a large amount of White Pine machinery, also a great number of pan bottoms of a new style for use everywhere. The foundry presents a scene of the greatest activity in every department during working hours. It is one of the most important and successful institutions in the State.—*Gazette.*

THE CHILEAN EXHIBITION IN APRIL.—According to late intelligence from the South American coast, it appears a considerable number of manufacturers and agriculturalists in England, France and the United States, are preparing to forward articles to the exhibition.

GOVERNMENT SALE OF GOLD.—In accordance with instructions received by the Assistant U. S. Treasurer in this city, $1,000,000 in gold coin will be sold for currency in lots of $250,000 each, the first lot being offered on the 23d instant. The sale of this money will retain between $7,000,000 and $8,000,000 on this coast, which amount has heretofore been shipped East yearly.

IMPROVED INNER SOLES
—FOR—
BOOTS AND SHOES.

Those who have worn Daggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the correct principle has been hit upon and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 15 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article ever invented. CHARLES K. DARLING, Stationer.

Patent Elastic Ventilating Soles—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, $1. By mail, postage paid, $1.25. For sale by PATRICK KELLY, No. 327 Bush street, San Francisco. 3v15tf

---

Read and Subscribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the MINING AND SCIENTIFIC PRESS, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec. 19.*

W. FRANK STEWART is Dewey & Co's accredited agent for the Patent business in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—This journal is devoted to mining and scientific researches, and has been conducted with great ability. It has been greatly enlarged and improved.—*San Jose Patriot.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 16th.*

TO ALL we may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the PRESS will be found a valuable paper.—*Oakland Trans script.*

THE PRESS is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

THESE gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette,*

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS has entered upon another year's work looking improved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

THE MINING AND SCIENTIFIC PRESS commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

WE CONSIDER THE MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

A VALUABLE PAPER.—For many years after the American settlement on this coast, a journal devoted entirely to mining and scientific interests did not exist. Vast sums of money were expended, or rather squandered, by capitalists and others, for lack of proper practical and scientific information about the mines and their developments. This necessity has been fully met by the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., at No. 414 Clay street, San Francisco.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

A USEFUL PUBLICATION.—The MINING AND SCIENTIFIC PRESS, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the patents for nearly all California inventions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

New Mining Advertisements.

Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of January, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
F C McComb	59	12½	$25 00
E C McComb	81	28½	56 25
Martin White	5	15¼	30 00
H W Hall	45	25	50 00
John R Mead	49	25	50 00
J H Pearson	64	2½	5 00
Wesley Hendersont	67	100	200 00
Albinus Ingle	71	5	10 00

And in accordance with law, and an order of the Board of Trustees, made on the thirteenth day of January, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on Monday, the eighth day of March, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M BUFFINGTON, Secretary.

Office, 37 New Merchants' Exchange, California street, San Francisco. feb20

Golden Rule Mining Company, Tuolumne County, California.—Regular Bi-monthly dividend (No. 18) of the Golden Rule Mining Company, of Tuolumne County, Cal., of 2½ per cent. per month, or fifty cents per share, is now declared, and will be paid to the Stockholders on and after the 26th inst. Office, 432 Montgomery street, Room No. 5.

J. B. RUSSELL, Secretary.

W. T. BOSWORTH, President.
A. S. PIERCE, Superintendent of Mine. feb20

North American Wood Preserving Company.
Location of Works: San Francisco, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fifteenth day of January, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John L Samuels	....not issued	800	$800 00
George W Dent	1	400	400 00
Henry S Dent	....not issued	200	200 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of January, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 430 Montgomery street, San Francisco, Cal., on Monday, the eighth day of March, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. B. LAKE, Secretary.

Office, 430 Montgomery street, San Francisco. feb20

Star Creek Mining Company.—Location: Star District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of February, 1869, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twelfth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

feb20 HORACE MORRISON, Secretary.

Mining Notices--Continued.

Chloride Mountain Tunnel and Mining Company.—Location of Works: White Pine Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of February, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 615 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the tenth day of April, 1869, to pay the delinquent assesment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAMES RICE, Secretary.

Office, No. 615 Kearny street, San Francisco. feb13

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of January, 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventeenth day of March,. 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. J. CROWNINSHIELD, Secretary.

Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. jan30

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1869, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 426 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth (5th) day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth (30th) day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

R. N VAN BRUNT, Secretary.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's bill on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

23v16-1y G. H. NOTT, Pres.

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the time you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

LEA & PERRINS'

CELEBRATED

WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only

GOOD SAUCE.

The success of this most delicious and unrivaled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-1y

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

The First Locomotive.—Pen-y-darran, Wales, is chiefly remarkable for its connection with the first tramway,—for which an act of Parliament was obtained in 1803 for the first locomotive ever tried,—and with the able inventor Trevethick. who there made his first essay. The first run of the locomotive occurred in February, 1804. Previously there had been a whisper in the scientific world of the use of steam and of its employment in propelling vehicles, and abortive attempts having been frequent. Samuel Homfray by some means was brought into connection with Trevethick, and the result was that this able but eccentric man visited Merthyr, and in conjunction with a self-taught mechanic, one Rees Jones, whose homely portrait can be seen in the Kensington Museum, began to build his locomotive. Building is not an inappropriate word in this case, for the stack was actually built up of bricks the same as an ordinary chimney, and the whole affair was peculiarly odd. The stack was tall and clumsy, the body dwarfed, perched on a high framework, so as to approximate to the spider fashion; the cylinder, in addition, was upright; the piston worked downwards, and at every revolution of the wheels there was a monstrous clang produced, which, heard nowadays with the asthmatic puffs of steam, would provoke the gravest mechanician to laughter. When completed Homfray introduced his friend Richard Crawshay to the novelty, doubtless much to that individual's amusement, certainly to his incredulity as to its being fit for anything, for he readily accepted a wager with Homfray for £1,000, maintaining that it would not convey a load of iron from Pen-y-darran to the Navigation—a distance of nine miles. The eventful day arrived for the trial, and never had there been so much excitement. The sturdy Englishmen were there, and natives from every Welsh county lined the road, and mounted every eminence that commanded the tramway; and when Trevethick jumped on his iron steed, and began slowly to move onwards amidst clanging iron and puffing steam, the uproar was terrific. By the arrangements made no one was allowed to assist the dauntless Cornishman, and for a time he did not seem to want it. Surrounded by a host, he passed down the valley making about five miles per hour, when a sad misfortune happened,—the clumsy stack came in contact with a bridge and was ruined! Trevethick stood for a moment amongst his bricks, but only a moment. Fertile in resources, he was soon steaming onward again, and not only conveyed his load of iron to the Navigation, but a crowd of exultant passengers along with it, who to their latest day prided themselves on their glorious ride. It was fortunate for Homfray that the wager was a loose one. The iron was taken down and the bet won; but Trevethick failed to bring his empty trains back, and for some time the feasibility of the new invention as a mode of transport remained in abeyance.—*The Engineer.*

An Immense Gravel Mining Enterprise.—Many of our readers are aware that there is a large range of rich ground some three miles in length and from one to one and a half miles wide, extending from Badger Hill in Bridgeport township, to Columbia Hill in Bloomfield township. This ground has been worked, but the bottom has never been reached. The lead was struck at Badger Hill a year or two ago, and $30,000 taken out in a few weeks; but the Columbia Hill bottom has never been reached. The gravel pays from the very surface, and millions of dollars have been taken out by the Shady Creek outlet. A project is now on foot, backed by abundance of capital, to get an outlet for the extensive range from the Middle Yuba. The parties undertaking this work are Mills, McMurray, Cook, and Hunter. They propose to commence one hundred feet from the river, and run a bedrock tunnel 1,900 feet to Badger Hill. By this tunnel they will be able to clean up to the bottom for three miles, and to wash off one of the richest ranges on the coast. It is estimated that the enterprise will cost in the neighborhood of $80,000, and it is certainly one of the best enterprises in the State. We had rather have this than the Eberhardt mine to-day.—*Nevada Transcript, Feb. 11th.*

National Bureau of Statistics.—Gen. Francis A. Walker, for some time connected with the editorial department of the Springfield (Mass.) *Republican*, is to take charge of the statistical work of the Revenue Department under Mr. Wells. He is said to possess qualities of industry, intelligence, and knowledge of finance that will make his services of great value there. Delmar retires. Conducted by a thinker, the bureau of statistics must prove of very great national value.

COMMENCING OPERATIONS ON A VEIN.—J. S. Phillips writes as follows on this subject, in a communication to the *U. S. Railroad and Mining Register* of Philadelphia:

The first and most important duty of the qualified expert is to make a most careful examination of the vein, by every means within his power, such as indicative matrices, position in stratum, surrounding junctions of other strata therewith, and to assay a well assorted average of the ledge for its value; secondly to these, the natural facilities for development of mine and shipment of produce—as water power, fire wood, easy access, cheap labor, etc., must be considered; and lastly, the best methods for reduction of the ores into marketable condition. If, after due consideration of all the necessary facts, the property is deemed worthy of trial, a further examination should be made, by a few shallow pits, to ascertain where the lode is most enticing in appearance for value, and a shaft sunk therein, first by hand tackle, then by horse or steam power, as deep as may be deemed requisite for a fair trial: in the meantime it will be expedient to explore the ledge linearly by a drainage tunnel, which will expose the value of the vein, drain the water away at this depth, and greatly assist the general development and ventilation of the works.

LARGEST ROLLS IN THE WORLD.—There was recently cast at the Phœnix Foundry, Bilston, England, a pair of iron rolls for Sir John Brown's works at Sheffield, said to be the largest rolls in the world. These rolls are fifteen feet six inches in extreme length and three feet in diameter, and each weighs eighteen tons. They are to be used for rolling armor-plates.

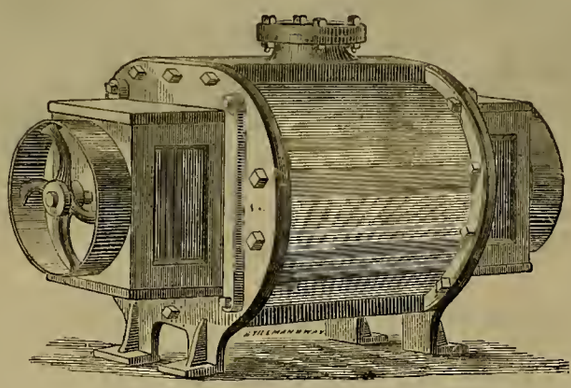
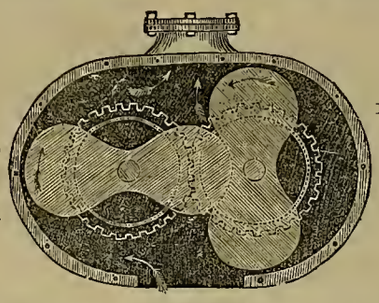
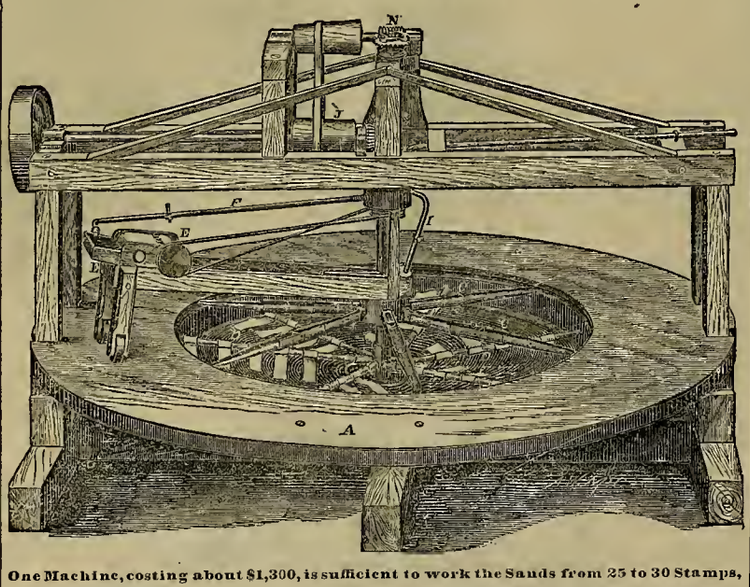
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.


ADAPTED FOR Smelting, Foundry, Mining and Steamships.


REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.
For circulars and further information, address
KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.


One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,
Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.
CERTIFCATES:
GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.
This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.
NEVADA CITY, Oct. 26, 1868.
Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

VENTILATION ALARM FOR THEATERS AND CHURCHES.—Plants take up carbonic acid, and give off oxygen, while the animal creation reverses the process; taking up oxygen and giving off carbonic acid, which is poisonous when the air contains more than three or four per cent. of the gas, destroying life, putting out candles, etc. The product of burning wood or coal is carbonic oxide CO and carbonic acid CO ; these are the operating agents in the French lover's suicide. When derived from exhalations of the lungs, in apartments having cracks, or doors that are occasionally opened, there is seldom closeness enough to reach the absolutely poisonous percentage, though it may be the predisposing cause for coughs, colds, consumption, etc.

An apparatus for giving an alarm in case of the presence of carbonic oxide or coal gas in a room, has recently been invented by a Prussian; and if a similar reaction could be brought into operation to show the existence of an injurious percentage of carbonic acid gas in churches and theaters, the community might be freed of many ailments, which are not often enough connected with the true cause. The apparatus in question consists of a galvanic battery with a bell and a glass tube filled with liquid chloride of palladium. This metallic salt is extremely sensitive to the pressure of carbonic oxide gas. A small quantity of the gas will at once throw down some of the metal from the solution, and this precipitate collecting in the bottom of the tube, at once establishes a connection in the current of electricity, and the violent ringing of the bell will warn the sleeper of danger.

At a recent meeting of the New York Board of Health, Engineer Mathews asked for an appropriation of $50 to purchase apparatus for the purpose of analyzing the air in theaters, public schools, and churches. The apparatus is simply a silk bag of large dimensions, which is suspended from the roof. After the bag is inflated it is closed like a balloon and its contents analyzed.

WILLAMETTE UNIVERSITY.—This institution located at Salem, Oregon, has become one of the most important, at present, amongst our young and flourishing seats of learning on the Pacific Coast. It is a university in fact, having its several departments well attended to by full corps of able professors. From the Professor of Chemistry,—the well known mineralogist Dr. Veatch,—we obtain the following complete list of professors in the Medical Department:

H. Carpenter, M. D., Professor of Surgery.
D. Payton, M. D., Professor of Physiology and Hygiene.
E. R. Fiske, M. D., Professor of Pathology and Practice of Medicine.
J. Boswell, M. D., Professor of Obstetrics and Diseases of Women and Children.
M. B. Lingo, M. D., Professor of Anatomy.
J. A. Veatch, M. D., Professor of Materia Medica and Toxicology.
Prof. J. H. Mitchell, Professor of Medical Jurisprudence, Portland.

Lectures commence on the 4th of November, annually, and continue four months—six lectures daily.

MORTARS, pestles, and other human relics have been found in connection with the bones of the mastodon, by John Dane, in a gravel mine belonging to him at Grass Valley ranch, Amador County.

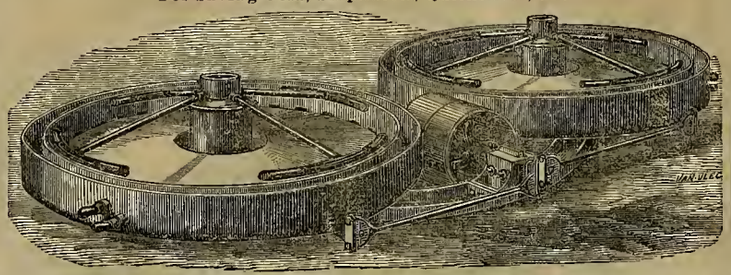
HUNGERFORD'S IMPROVED CONCENTRATOR,
For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir*:—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir*:—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Stock Prices—Bid and Asked.

The Standish Steam Plow.

We present herewith a side view of the newly-invented and already well tried Standish steam plow, from which a good idea can be obtained of the appearance and method of operation of that machine.

The invention, in brief, is an improved locomotive steam plow, so constructed that the power is transmitted directly from the engine to the plows or cutters, thereby greatly lessening the power ordinarily required for traction. It also consists in a novel mode of operating the plows, by which the earth is plowed transversely to the travel of the machine, and is thoroughly broken up and pulverized, so as not to need any further cultivation, the seeding being also done at the same time.

The plows are attached to a movable supplementary frame, which, by the proper mechanism, may be easily raised and lowered to regulate the depth of the cut, or they may be elevated so as to entirely clear the ground when necessary, while by a simple device the cutters are so mounted as not to be broken by stones or other obstructions.

To more fully explain the invention, reference may be had to the accompanying engraving and letters marked thereon. A very strong frame of wood supports the machinery and is mounted upon two broad wheels, B, B'. The front of the machine is supported by two guiding wheels, C, C, turning on an axle, which passes through a vertical standard, D, with a device at the point of its support on the axle, by which the wheels, C, C, are allowed to accommodate themselves to any irregularities of the surface. A gear wheel, E, is keyed to the top of the standard, D, and is turned to the right or left by a screw, F, working in its teeth, and operated from the platform, G, by a long rod and a wheel or crank attached. The engines, I, I, and boiler, are supported upon the frame and suitably stayed, so as to be firm. An upright tubular boiler is preferred, in order to accommodate the machine to declivities, without danger by a change in the water level, as would be the case in a horizontal boiler, and also to economize room. A pair of horizontal engines, as shown, will give the requisite power, and will be much more steady in their action than would be possible if they were vertical. The plows or cutters are driven by the beveled wheel, U, on the shaft, K, also thrown in and out of gear by a clutch, as shown, and which, by engaging the wheel, V, turns the shaft, W, and through this the beveled gear, X, at the other end, by which means the plows or cutters may be revolved. The cutters are mounted upon a supplementary frame, h, h, which has the arms extending forward to a point at the sides of the frame, where they are pivoted so as to be movable about an axis in a line with the engine-shaft. The driving gear, x, is keyed to a horizontal shaft, and by means of the beveled gears, g, g, drives the vertical shafts, h, h, which operate the cutters or plows. A disk, i, is keyed to the bottom of the cutter shaft or spindle, b, and has the arms, k, k, projecting from it, radiating from the center. These arms are bent at right angles at the outer ends so as to form supports for the axes of

THE STANDISH STEAM PLOW.

the hubs, m, m, to which the cutters are attached. The cutters, n, n, pass vertically through the hubs, and when not fastened, can turn with them about their axes. For use in soil that contains but few stones, the cutters are retained in position by light supporters; r, r, which may be made of cast iron. The supporters are bolted to the arms, k, k, and each have a slot made in the projecting end which clasps the head of the cutter, and holds it rigidly in place under the ordinary strain of plowing; but if the cutters strike a stone or other obstruction, one of the projecting lugs or sides will be broken off; so that the hub can revolve, the cutter being swept backwards until the obstruction is cleared, when a new supporter can be attached. As these castings cost but a few cents, and are easily replaced, they will serve as an efficient protection to the cutters. But if the soil be very stony or full of obstructions, the cutters may be kept in position by a stiff spring which is attached to the arm, k, and curved around so as to clasp the cutter below the hub. This spring is sufficiently stiff to withstand the ordinary strain of plowing, but will yield to any great obstruction, so as to allow the cutters to pass over it. The cutters may be either straight or curved, as may be the most efficient. They are elevated or depressed by various devices, one of which is shown at *l*, being a screw operated by a wheel from the platform, G. Any approved seed sower may be attached to this apparatus as shown at u, having distributing pipes, V, so that the grain may be sown, and then plowed and harrowed in. A roller, or a series of broad wheels, J, are attached to the frame, b, so as to run on the ground just in front of the cutters, thus regulating the depth of the cut, and preventing them from being thrown out by inequalities in the surface.

The following is quoted from the circular of the "California Steam Plow Company," as the best account we can give of the aims and intentions of the inventor and manufacturers, in presenting to the agriculturists of California a practical method of applying steam to farming:

"The Standish Steam Plow has at last arrived at such degree of perfection that we can now safely offer it for sale to the farmer and others who wish to engage in steam cultivation. After repeated tests, and the most severe trials for two seasons of plowing, we can now answer the often-asked questions, What can the Steam Plow do? What does it cost? Will it pay? etc. This principle of plowing is entirely different from any ever yet invented, and combines the harrowing and plowing in one and the same operation. It most effectually pulverizes and mixes up the soil to any required depth, from two to twelve inches, cutting up and destroying all grass and roots, and thoroughly incorporating and combining the surface dirt with that underneath, leaving the soil in a light, mellow condition from top to bottom, at the same time electrifying and aerating it by means of astonishingly rapid motion. This is no digger, or spader, or revolving cylinder, or paddle-wheel propeller, or scratcher,—devices tried and condemned years ago. The principle is that of horizontal cutters working on a vertical axis, having been invented and wrought out by the necessities of this age of progress.

What has the plow done? It has plowed hundreds of acres of land from which splendid crops are growing, that promise an increased yield such as will more than pay the expense of plowing; it has plowed at the rate of three acres per hour, at a cost of from seventy-five cents to one dollar an acre. It consumes from forty to one hundred pounds of coal per acre, or its equivalent in other fuel. It uses up from eight to fourteen cubic feet of water per acre. One hundred and eight pounds of cast steel cutters will plow 1,000 acres, which, at thirty cents per pound, is equal to 3½ cents per acre; cost of sharpening, ten cents per acre on an average. The locomotive requires an engineer, a steersman, and a man with team to supply fuel and water. This estimate is made upon a depth of five and six inch plowing, and with a plow cutting to the width of twelve feet. An increased depth will proportionately increase the expense. The locomotive admits of a graduated speed to suit the various conditions of soil and kinds of work required; advancing from 150 to 350 feet per minute when plowing, and seeding the land at the same time, if desirable. This principle of plowing does not drag or retard the propelling power of the machine, but rather assists it, and crowds forward, thereby preventing the tendency of the locomotive to settle down in soft soil. The driving wheels are broad and of large diameter, being six feet diameter on the small plows, and ten on the large ones, and covered with a soft spongy wood, affording at the same time elasticity and great adhesion to the ground. This method is very successful, answering the purpose of india rubber, and being extremely economical, as they require covering but once in a season. Two-inch plank or scantling in the rough state is preferred, cut the requisite length and spiked on the main tread. We use Oregon spruce and fir; bass-wood or peppsrage wood answers admirably. The main weight is carried upon the two rear driving wheels, and the power is applied as near the periphery as possible, the forward wheels serving as guide wheels, and but a small part of the weight of the locomotive resting upon it.

Our machine will ascend quite steep grades, say one in four, and performs wonders on the common road in the way of hauling loaded wagons, gang plows, etc., although not expressly built for that purpose; as a steam-power to drive threshing machines, saw wood, pump water, run grinding mills, haul grain, and general service on the farm, they are not to be excelled. They can be sold at the following rates:

4½ feet cut, 10-horse power, plowing capacity from ¾ to 1½ acres per hour, for $2,800.

6 feet cut, 15-horse power, plowing capacity from 1 to 2 acres per hour, for $3,500.

8 feet cut, 20-horse power, plowing capacity 1½ to 2½ acres per hour, for $4,400.

10 feet cut, 30-horse power, plowing capacity from 2 to 3¼ acres per hour, for $5,900.

12 feet cut, 35-horse power, plowing capacity from 2½ to 3¾ acres per hour, for $7,500.

16½ feet cut, 60-horse power, plowing capacity from 3 to 5 acres per hour, for $12,000.

Weight, about 400 pounds to each horse power.

This plow drew the gold medal for the best California invention at the Mechanics' Institute Fair of 1868; also a diploma and prize of $300 at the California State Fair of 1868. It is patented in Europe, and the patents for France, England and Russia are now offered for sale; also the right for use and manufacture in the United States, excluding the Pacific Coast.

For further information, address Mr. P. H. Standish, San Francisco, Cal.

COOKING "LABORATORY."—Professor Blot, the scientific Frenchman whose lectures on cooking attracted attention a few years ago, is about to establish in New York a laboratory for the preparation of soups and meats, preserved in hermetically sealed cans intended to bear transport and storage. He has been for nearly a year engaged at the Rumford Laboratory in Boston in similar business.

Facts and Science of Silver Ore Deposits.

The naturs of ore deposits is of itself a science; bnt neither chemical geology nor the valuable generalizations which have been made from a systematic comparison of the important ore deposits of the mining world, have proved sufficient to furnish the prospector with an infallible rule, which is not likely to appear false in some new locality, by reason of altered conditions. Ample information with regard to occnrrences in like formations, in the hands of persons intelligent enough not to go to extremes in their deductions from only locally correct theories, is the safest, and in general the only guide. It is for this reason that laboring miners, even the most ignorant, are frequently the best judges of the value of a vein or deposit not yet explored; at the same time that to be guided implicitly by their verdict in a new situation, perhaps deduced from trifling or irrelevant circumstances, would frequently be as ridiculous as following the witch hazel.

THEORIES AND FACTS.

A well informed mining geologist is slow in "running to theory," on the subject of the probable yield of any given deposit, but is always able to furnish valuable information bearing unequivocally upon the probabilities in the case; furnishing, therefore, the necessary data for action in the premises.

The following instances, quoted from the *Times*, are illustrative of the liability to error of theorists, be they ignorant or well informed as to the established generalizations of science, on venturing to express conclusions from a too limited knowledge of the nature of the ore deposits and of the country they are dealing with:

In 1863 a company of capitalists in Sacramento employed a very eminent mineralogist, since deceased, to represent them at Reese River. He spent the entire summer in the Reese River and Humboldt country without acquiring any property for his company, simply because the country formation did not correspond to his preconceived ideas of what a silver-producing region ought to be. He predicted that the mines of Central Nevada, and especially about Austin, would have no permanence—pinching out in the hard granite at a slight depth. Fortunately his theories and speculations have not been sustained by the subsequent developments in that country. A San Francisco expert, not long since, made an elaborate report on the silver mines of Central Nevada, in which he was particularly severe on the "impoverished limestones" of the Hot Creek country—and, in fact, by implication, all the central portion of the State.

We find the following interesting facts in regard to leading silver ore deposits in Mexico and in Nevada, (with several very unjustifiable deductions therefrom) in an article by "W. W. P.," published in the *Times* of February 20th:

INFLUENCES OF GEOLOGICAL FORMATION, AND DIRECTION OF VEINS.

After an examination of the mining districts of Mexico and subsequent fair experience in the three most important—says the writer—the conclusion is, that silver deposits itself irrespective of geological formation. The direction of the veins, however, appears to modify the elementary composition of the ore. Instances:

EAST AND WEST VEINS HAVE DOCILE ORES.

In the Real del Monte, twenty-five leagues north of the City of Mexico; formation, hard porphyry interstratified with greenstone syenite, gray trap, amygdaloid trap, conglomerate; contains east and west veins—also north and south. In former times the work was confined to two—east and west veins—the Tapona and the Biscaina, running about east and west, sometimes parallel, then in contact, but never interlacing. Subsequently in driving the adit of Moran, the veins of Morau, Rica, San Estephen and Acosta were found; later and farther north, in driving the deep adit, the veins of Valenciana Onyaguez and San Felipe.

This system of veins appears to belong to the Canada of Omitlan, and yield docile ores.

NORTH AND SOUTH VEINS HAVE CALCINING ORES.

In Real del Monte are found the north and south veins of Santa Brigida, and Santa Ignes, yielding ores requiring calcination.

CONTACT VEINS MAY BE AS RICH AS TRUE FISSURE VEINS.

At Guanajuato, in going up the cañada, the whole distance (being about six miles) high walls of jasper conglomerate, containing enormous boulders present themselves—an old sea bottom, in fact. Between this conglomerate and a mountain of chloritio slate, is the celebrated Veta Madre, with the ruins of magnificent mining establishments and specimens of the most skillful mining works ever laid out by man. This vein built up and maintained one hundred years and more a town of 80,000 people, and has this grand mass of sea bottom for a covering, a mountain of chloritio slate to repose upon, and carbonate of lime for its gangue. A sight of these conditions should do away with the prejudice in favor of fissure veins—and against veins of contact, saying nothing whatever about the nature or the want of nature of the formation contacting.

A CASE OF POOR CROPPINGS AND DIFFERENT COUNTRY ROCK.

Now, step out to "La Luz," about ten or twelve miles from Guanajuato; you will find a range of mines surpassed only by those of the mother vein (Veta Madre), and convergiug with her in their course northerly, and which prejudice would not turn her eye to for more than two hundred years, simply because the vein did not assay in the croppings and the formation "Diorite."

ONLY EAST AND WEST VEINS RICH AT ZACATECAS.

This district contains as mother veins the Quebradilla, the Cautera, the Veta Grande, and Panuco, parallel, and from one to three miles apart. There are hundreds of intermediate veins not worth speaking of, although they yield a great deal of money. (Zacatecas miners and good engineers, too, will tell you that it is useless to look for large masses of ore in north and south veins). The four principal veins, however, run ahont east and west, the others in any direction, and one as good as the other.

SYENITE COUNTRY ROCK BARREN, AND GREENSTONE RICH.

The syenite, on ths south, appears to be barren; on the north of the district it has yielded from "Panuco" an enormous amount of money. The formation which has yielded the most of the one thousand millions of dollars is a compact greenstone, carrying some very unwelcome etrata of slate, which, in this district, acts like poison on the ore when the vein comes in contact with it.

AT FRESNILLO, DIP AND FORMATION MAKE NO DIFFERENCE.

Fresnillo, also in the State of Zacatecas, and until lately a very important district, revived in 1827, and since then has maintained a city of abont 18,000 inhabitants. These mines are 2,000 feet in depth. The principal system of veins run from southeast to northwest, crossed by various others running east and west. In both systems, one vein dips one way and another another, without prejudice to their yield, and do the same with the formations they penetrate, starting in gray wacke, passing (richly) through clay slate, then into calcareous slate, then limestone, then slate, then wacke, slate, limestone (a fine school).

ORE ON HORIZONTAL SHELVES ON EACH SIDE OF THE VEIN.

Now step over to the State of Potosi, over horrid alkaline plains, with a drinking-place for your animals (but none for you) about every fifteen leagues, and have a look at the mine of San Augustin, in the district of Cartorce. The formatiou is apparently a homogeneous mountain limestone, but in cross-cutting from the vein it is found to be as rich in marine fossils as the limestone of White Pine. The peculiarity about this fissure vein is that the ore is not found in the vein at all, but in horizontal shelves on each side of the vein, the latter being simply a guide to the engineer. This is still a very important mine and district, and like that of White Pine, admits of two systems of mining, one for the poor man and one for the rich—the first for superficial deposits, the second on the well formed, robust and rich veins, requiring capital for their development.

It may have some effect in allaying the anxiety of the people as to the permanency of the mines in the limestone formation, to state that San Augustin is now 400 yards deep—and would that the Comstobk looked as well in the bottom.

FACT AND THEORY ABOUT THE HEADS OF CANONS.

As this is an attempt to guide explorers, the writer will point out another fact,—that the best mines of a district are generally found at the heads of the cañons. Now all the districts that I have spoken of, save Fresnillo, have their *canones*, and even that may have a subterranean one. Nay, some, like White Pine, with her Shermantown Cañon and Hamiltou Cañon, have two. The good mines of "Real del Monte," at the head of the Cañon of Omitlau; the "Veta Madre," at the head of the Cañon of Guanajuato; the "Quebradilla," at the head of the Cañon of Zacatecas; the mine of "Urista," at the head of the Cañon of Sauceda, in the same district, and twenty-two other *bonanzas*, varying from five to forty millions each, from mines on the same Veta Grande, crossing the heads of the branches of the same Cañon of Sauceda. Nearer home, Gould & Curry, at the head of Gold Cañon; the Ophir, Gould & Curry, and Savage, crossing branches of the Six-Mile Cañon, yielding up the metals they have brought from the plains at the point of contact of the saturated porphyry and hard hornblendic rock. Waste not your time on hillsides. Follow up the cañons.

ORIGINAL THEORY ANOUT TWIN DISTRICTS.

The foregoing is respectfully submitted to the noble and hardy band of men devoted to the exploration of the Grsat Basin, the bottom of the once Mediterranean of this continent. They will find each district twins, good mining grouud within, say, ten miles of each other; expsct then to find another pair within one hundred miles in any of the cardinal directions.

W. W. P.

Portland and its Realm.

Wo have recsived from Mr. J. McCormick, the editor of the "Oregon Almanac," a copy of the Portland Directory for 1869, containing a map of Portland, and a great deal of interesting statistical information relative to the progress and prssent condition of that northern business center, from which we make ths following extracts:

PERMANENCY OF PORTLAND.

Portland has enjoyed more than ordinary prosperity. In the line of permanent improvements alone, it is safe to estimate that more than douhlo the amount of capital has been invested in the improvement of real estate—erecting brick buildings, stores, warehouses, and other permanent structures—during the year just closed, than had been invested in a similar class of improvements during any two years previons. This gratifying fact may be attributed to a variety of causes, the more prominent among which is tho settled fact that has worked conviction in the minds of capitalists—*Portland has ceased to be an experiment.*

MANUFACTURING INTERESTS.

In every department of industry we find active demand existing for all articles now being manufactured in our midst. Scarcely a month passes without some new branch of manufacture being introduced, and in this manner we are rapidly devoloping a trade for home-manufactured articles which must ultimately be conducive of a vast amount of benefit, not only to those interested but the success of home manufactures will also be found to exercise a marked influence on the prosperity of the entire State. A few years ago all the machinery used in working the quartz mines of Eastern Oregon and Idaho had to be procured in San Francisco and shipped to its destination through Portland, but a change has gradually been working in this branch of industry as in many others, as we find that quartz mills and other mining machinery can now be manufactured in Portland as speedily, successfully and economically as at any point on the coast.

AGRICULTURAL MACHINERY.

Oregon is destined to become the great agricultural State of the Pacific, hence the requirements for agricultural machinery will annually be on the increase; it is well, therefore, to begin in time to make such preparations as are requisite for the manufacture of that class of farming machinery without which agricultural pursuits cannot be carried out on a scale of such magnitude as the future export trade of this country will warrant. With inexhaustiblo beds of iron ore, within a few miles of the city—smelting furnaces already in operation, and with foundries and machine shops capable of construeting every variety of agricultural machinery, there will hereafter be no necessity of sending beyond our own borders for that class of machinery now being manufactured at home.

STEAMBOAT COMMUNICATIONS.

Portland and Astoria—Steamer "John H. Conch" leaves Portland Monday and Friday, at 6 A. M. Arrives at Astoria same day, 5 P. M.

Returning, leaves Astoria Tuesday and Saturday, 7 A. M. Arrives at Portland samo day, at 6 P. M. Distance 110 miles; fare $5; freight per ton, $6.

Portland and Monticello—Steamer "Rescue" leaves Portland Monday, Wednesday and Friday, at 7 A. M. Arrives at Monticello same day at noon.

Returning, leaves Monticello Tnesday, Thursday and Saturday, at 2 P. M. Distance, 45 miles; fare, $1; freight per ton, $2.

Portland and Dalles—Steamer "Wilson G. Hunt," "Cascades," or "Julia," leaves Portland daily, Sunday excepted, 5 A. M. Arrives at Cascades at 11 A. M., and there connects; by the Cascade railroad, with the steamer "Oneonta," on the middle Columbia. Arrives at Dalles same day, at 4 P. M.

Returning, steamer "Oneonta," "Idaho" or "Iris," leaves Dalles at 5 A. M., connecting as above with railroad and lower steamers. Arrive at Portland same day at 3 P. M. Distance, 124 miles; fare, $6.25; freight per ton, $15.

Dalles, Umatilla, Wallula and Lewiston—Steamers "Owyhee," "Spray," "Web-Foot," "Yakima," "Tenino," or "Nez Perces Chief," leaves Dalles on Tuesday, Thursday and Saturday, at 4:30 A. M., by the Dalles railroad, connecting with the steamers on the Upper Columbia. Arrive at Umatilla same day, at 5 P. M. Distance, 97 miles; fare, $10; freight per ton, $15; Arrive at Wallula next day, at 6 A. M. Distance, 121 miles; fare, $11; freight per ton, $20. Arrive at Lewiston on the following day. Distance, 284 miles; fare, $20; freight per ton, $45.

Returning on alternate days.

Portland and Oregon City — Steamer "Alert," leaves Portland for Oregon City every morning at 6½ o'clock. Returning, leaves Oregon City for Portland at 1 o'clock, P. M.

Steamer "Senator" leaves Oregon City daily, (Sunday excepted) at 8 A. M. Returning, leaves Portland at 2 P. M.

Oregon City and Corvallis — Steamers "Tannie Patton," "Albany," "Active," and "Reliance," leaves Oregon City for Corvallis and intermediate points every morning, npon the arrival of the "Alert" from Portland.

For Eugene City—Steamer "Echo" leaves Canemah onoe a week for Eugene City.

For Lafayette and Dayton—The steamer "Union" leaves Oregon City every Monday, Wednesday and Friday, on the arrival of the "Alert."

For Colfax—The steamer "Onward" leaves three times a week for Hillsboro.

Portland and Vancouver—Steamer "Fannie Troup" leaves Portland every day at 2½ P. M., (Sunday excepted) for Vancouver and intermediate points. Returning, leaves Vancouver every morning at 8 o'clock.

For Monticello—Steamer "Ranger," J. N. Fisher, Master, leaves Portland for Monticello every Tuesday, Thursday and Saturday, returning alternate days.

Portland and Oregon City—Willamette Steamboat Co's steamers "Carrie" and "Wenat," daily. Returniug every afternoon.

RAILROAD COMMUNICATIONS.

The Oregon Central Railroad is the line following np Willamette Valley, entering Sacramento Valley at its head, and connecting with California roads. Its actual building is being pushed very energetically, by two rival companies, the "East-side" and "West-side," which will construct two roads throughout the length of the Willamette Valley, to Corvallis, from which point southward the ronte is identical. To all appearance the California and Oregon Railroad is a fact, within a year or two of accomplishment.

THE LARGEST RAILWAY STATION IN EUROPE.—The London station at the terminus of the various branches of the Midland Railway, which has been some two or three years in progress of construction, was recently opened. The building is 700 feet in length, 240 feet in width, and 100 feet in hight. Its construction consumed 9,000 tons of iron, 80,000 cubic feet of dressed stone, and 60,000,000 of brick, to say nothing of the many thousand feet of timber and glass. It is already one of the sights of London, and it is doubtful if it will ever be exceeded, as no other company can ever require a building of such magnitude.

Mechanical.

The Ellershausen Process.

The *Iron Age* describes in full this recent and remarkable invention, and says it is being already rapidly introduced all over the country. The process consists in the conversion of crude cast iron, as it runs from the smelting furnace, into wrought iron, by the simple admixture of granulated iron ore. It is carried out at the works of Messrs. Shoenberger, at Pittsburgh, in the following manner: On the casting floor of the smelting furnace, a cast iron turn-table, about 18 feet in diameter, is revolved on rollers by a small steam engine. Upon the outside edge of the table stand a row of cast iron partitions, forming boxes, say 20 inches wide and 10 inches high, open at the top. Just above the circle of boxes stands a stationery, wide-mouthed spout, terminating in the tap hole of the furnace. When the furnace is tapped, the liquid iron runs down this spout in a thin stream into the boxes as they slowly revolve under it, depositing in each a film of iron say one-eighth of an inch thick. But before the fall of melted iron reaches the boxes it is crossed, at right angles, by a thin fall of pulverized iron ore, which also runs out of a wide spout from a reservoir above. The thin layers of iron and ore soon chill and solidify, so that by taking away the outer partition of the boxes (which form the rim of the turn-table) they may be removed in cakes of the size of the boxes, and weighing about 200 lbs. each. Four of these cakes or blooms are put into a reverberatory puddling or heating furnace, and raised to a bright yellow heat. They will not melt at this heat, but become softened so as to be easily broken up with a bar. The four blooms are formed in the furnace by the "rabble" of the workmen, as in ordinary puddling operations, into eight balls. The balls are brought out, one after another, squeezed in the ordinary "squeezers" to expel the cinder and superfluous ore, and then rolled into wrought iron bars.

Ingenious Compass to Indicate Local Attraction.—A citizen of Roanoke County, Va., Mr. Samuel Custer, has invented a compass, which professes to show the presence and direction of local attraction, the extent of the same, and to indicate, under all circumstances, the magnetic meridian as truly as does any compass when under no local influence. It consists of three systems of magnetized needles, or bars, (each system numbering from two to a dozen bars) arranged in different horizontal planes. When placed on board an iron ship, for example, the middle system of needles is adjusted at a point on a perpendicular rod in such a manner as to repel the upper needles back to the magnetic meridian. It is only necessary to adjust the middle system of needles with reference to the local attraction existing on board of that particular ship. No change in the direction of the ship makes any difference in the pointing of the upper needle; while the lower systems have a graduated card attached to the upper end of the axle to which they are attached, to indicate their movements.

Wooden Car Wheels.—The New York *Post* says that wooden wheels are coming into favor. They are used on the London Underground Railway,—and the Hudson River Railroad Company has recently placed twelve of them upon their "drawing-room cars" as an experiment. These wheels,—the "Mansell",—are made of seasoned elm or teak, with steel tires. Although they cost three times as much as the cast iron wheels, they will wear eight times as long, owing to their elasticity. Moreover, the wear to the track is less. They are said to add much to the comfort of passengers; the motion of the car being so noiseless that conversation may go on without inconvenience, and so smooth that reading and even writing may be easily and comfortably done.

The Shelbourne Submarine Drill.—Hell Gate is to be cleared of rocks. Nitroglycerine will be used. Shelbourne's steam drill was at work on January 14th,—according to the *Tribune*,—in putting four 6-foot holes into the rocks at the bottom, to receive as many 6-foot ring-bolts, to which the vessel containing the apparatus will be moored in the midst of the boiling waters. The diver who superintends the work communicates with the men in the vessel by means of an electric bell. The reporter of the journal named above says the drilling of one of these holes occupied only one hour. The vessel was held in its place meantime by anchors. The work could go on only at a certain stage of the tide.

New Railway Joint.—An Edinburgh engineer has patented an improvement which "consists, in the first place, in the insertion of two cast iron keys or wedges, which are driven into the chair from opposite directions against the rail, and are tied together with a single bolt and nut in a direction parallel to the rail. Secondly, in casting on the inner surface of one side of the chair two projecting pins, which pass into elliptical orifices at the extremity of each rail opposed to the plane of the wedges, thus making the necessary provision for the expansion and contraction of the metals."

Broken Rails.—A writer in the New York *Times* suggests an oak plank a foot wide, fitted to the outside of the rail, bolted to it every three feet, and screwed down to every cross sleeper,—as a means of preventing those breakages of rails which are the cause of so many frightful accidents. It would not only lessen the chances for the breaking of the rail, but would prevent its displacement even if it did break. The car therefore could not be thrown off the track. To make this doubly sure, the writer in question proposes an *inside* plank also,—thinner than the first, to allow space for the flenges of the wheels. The cost,—he says,—would be some $2,000 per mile, and its saving of damage at least as much.

Power Looms.—The first power loom was constructed by Rev. E. Cartwright in 1787. In this country, Mr. Francis Lowell,—after whom the city of Lowell, Mass., was named,—employed a mechanic to build one at Waltham in that State. This was in 1815. Patterns had been received from Glasgow during the previous year, through William Gilmour, who built a loom soon after at Providence, R. I. This commenced the era of power looms in the United States; and the hand looms which had up to that time done all the work, become comparatively idle.

Clothing Boilers.—The economy of covering boilers with some non-conducting coat is strikingly shown by some recent experiments at the Newport (Eng.) iron works. The result was as follows: The conditions and circumstances being in all respects the same for two consecutive weeks, during one of which weeks the boiler was left uncovered, but during the other was covered with a certain patent cement, eleven thousand gallons of water was evaporated in the first case, against sixteen thousand in the last. The immense loss of heat, and of course waste of fuel, in the first case, is evident.

Machine Tools.—"One of the best features of modern mechanical engineering is the increased weight and better fitting of machine tools; not simply because the work they turn out is better done, but because it is done more cheaply. For instance, a light planer can neither take a heavy cut nor a true one. When work leaves a tool it should be finished—subsequent handscraping and draw-filing are neither beneficial nor economical. A planer can hardly be too heavy. Another feature of modern practice is the use of special tools that can do one thing rapidly and truly, instead of convertible tools that can do anything. Versatility is not to be condemned; but in the extensive and regular reproduction of a given product, the sphere of the Jack-at-all-trades is limited."—*Van Nostrand's Engineering Magazine.*

Scientific Miscellany.

Constitution of the Sun and its Source of Heat.

We condense the following from Prof. Henry Morton's lecture before the Franklin Institute upon "Sunlight and Moonlight":

"We believe that the Sun consists of a dense central mass, composed of only the most refractory materials, intensely hot, and probably fluid, at its surface, at least, with heat. From this supernatant ocean of melted matter, rise, continually, streams of vapor, which, at a certain distance, begin to condense, through loss of a part of their heat by radiation into space, and form clouds of minute liquid particles, intensely hot, and therefore luminous in a high degree. These clouds form the visible surface or photoscope of the sun, and are composed of such elements only as will endure an intense heat without vaporizing. Above this cloud region, extends another, which may be called the true atmosphere of the sun, being composed of such elements as are permanently gaseous under the conditions of high temperature there existing. Such substances as sodium, magnesium, calcium, iron, are believed to exist as permanent vapors in this region, as well as hydrogen and other gases. Into this region are occasionally projected denser aggregations of similar vapors, as of sodium, magnesium and iron, which float, for a time, as clouds of ignited gas, before diffusing among the surrounding mixed atmosphere.

As a source of this intense heat, we believe there exists the following action: The space of the solar system is filled with a vast number of ponderable objects, individually minute, but, in the aggregate, considerable. Some of these, from time to time, fall upon our planet, and are then called meteors; they are, however, much more densely aggregated as they approach the sun, and, by mutual interference and disturbance, will be constantly losing their orbital directions, and, under the influence of gravity, falling in upon the solar mass. A cannon ball has a velocity of 1,500 feet per second, or about one-third of a mile; it almost grows red-hot by its impact with an iron target; what heat would it develop if its velocity were 60 or 80 miles—that is, 180 to 255 times as great?

But what evidence have we that such masses of matter are in existence, and are rolling in upon the sun? The zodiacal light is the first proof. The most natural hypothesis as to this appearance in the plane of the ecliptic is, that there are here a cloud of minute bodies revolving around the sun, illuminated by his light. Variations in the apparent magnitude and intensity of the light, point to changes in the conformation of this swarm of minute planets, and agree with the supposition that part of them are, from time to time, falling in upon the sun. The next proof is furnished by the meteors. There are a great number of streams, rings, or elongated cosmical clouds of such bodies sweeping in, to and around the sun, from all parts of space. Through these streams the earth passes at certain seasons, and we then see a shower of shooting stars. It would appear from the observations of Schiaparelli and Newton, as well as of others who have given attention to Meteoric Astronomy, that the earth's orbit intersects at least thirteen of these streams, among which, some, as that of the November meteors, are well defined.

The mutual interferences in motion, and consequent in-fall upon the sun, of masses so grouped and thus moving, must be constant; and, indeed, in at least one remarkable case, we have palpable evidence of such an action. In December, of 1845, Biela's comet was seen to be divided in two, and, on the date of its calculated return, in 1865, it had disappeared entirely. Now, at each of these periods the comet appears to have passed through the orbit of the meteors of November 27th, whose direction of motion is retrograde, while that of the comet is direct; and it would thus seem that the resistance offered by the innumerable minute particles of the meteoric stream, had first divided the comet, and then caused it, together, no doubt, with these conquering atoms, to fall into the sun."

Volcanoes in the Moon.—Dr. Montucci, in a recent communication to the French Academy of Sciences, explains certain remarkable luminous protuberances upon the moon's limb, which were observed by M. de Créty at the time of the solar eclipse in August last; "The protuberances were either gaseous or composed of matter in an extremely fine state of division. If on the posterior [illegible] of the moon, invisible to us, there had been three volcanoes in activity at the time of the eclipse, and close to the moon's border, the smoke or ashes ejected by them would have been visible, and would have presented the appearance described by M. de Créty."

Dr. Montucci shows by calculation that an observer's eye could just skim the crest of a lunar mountain 786 feet high, at a distance of one degree from the border, or 6,000 feet of elevation at five degrees distance, in which case the whole volcanic jet would be lancet-shaped, because the moon's atmosphere, being infinitely thinner than ours, could not, by its resistance, force the ejected matter into a mushroom form, as is the case with our volcanic eruptions. Dr. Montucci proves that the jet must necessarily end in a point, and rise to an enormous hight. The three supposed volcanoes may very well have been in communication with each other, as is often the case on our earth. Hence, most probably, M. de Créty witnessed a volcanic action on the posterior hemisphere of the moon, for the first time manifested to us in this strange way.

Primeval Chemistry.

We quote the following from a lecture upon this subject recently delivered before the American Institute, by Prof. T. Sterry Hunt:

"Suppose the earth to be now melted with fervent heat. Every chemist can readily see that by bringing together the limestone and the waters of the ocean under such conditions, sulphur also being present, the sulphur, the chlorine, and the carbon would be transformed into gases; the alkalies, lime, alumina, and magnesia, would unite with the acid gases to form sulphates, carbonates, and chlorides, while the metals, with silica and alumina, would combine in the crust to form a substance similar in composition to what are now known as slags, and over and above this an atmosphere, charged with acid vapors—sulphur and carbon in the form of gases, and water in the form of steam, mixed with the elements of the atmosphere, nitrogen and oxygen, and carbonic acid, or the elements of carbonic acid in the free state. Under these conditions the atmospheric pressure would be immense, and the barometer would stand three or four times as high as it now does. Under the pressure of such an atmosphere, water and the less volatile materials would be precipitated upon the rocks. The water would, of course, be strongly charged with acids—hydrochloric and sulphuric—and being fluid, would fill the cavities and spaces in the solid earth. The result would be, at this high temperature, to give rise to the immediate decomposition of the silicates and carbonates, and set free the whole of the silica, while the acids would combine with the lime, magnesia, soda, and many of the metals; chlorides and sulphates would be formed, while the silica, separating, would form quartz. The salts of lime, magnesia, and soda would dissolve in the water, and form sea water. The activity of the combinations would gradually become less violent, as the affinities would be rapidly satisfied. The acids would combine with the rocks until they got their full equivalent, and then would commence a new process. A process of slow decomposition by air and water would now set in. Carbonic acid and water would attack the silicates, and take the lime from them; clay, bicarbonates of soda, etc., would be formed, which, dissolving, would find their way to the sea, where chloride of sodium or common salt would also be formed. This action is still going on upon the feldspathic rocks, decomposing the strongest quartz and making clay, though much less rapidly than formerly on account of the diminished quantity of carbonic acid in the atmosphere. Every lump of clay, then, upon the earth's surface represents granite decomposed, limestone formed, and salt added to the sea."

Death of a Naturalist.—John Cassin died in Philadelphia on Jan. 10th, aged 56. He was an ornithologist of note. He published a work entitled "Birds of California and Texas"—a handsome octavo volume, containing descriptions and colored engravings of fifty species not given by Audubon. He also published "Synopsis of the Birds of North America;" "Ornithology of the United States Exploring Expedition;" "Ornithology of the Japan Expedition;" "Ornithology of Gillis' Astronomical Expedition to Chili;" and the chapters on rapacious and wading birds in the "Ornithology of the Pacific Railroad Explorations and Surveys."

Difficult Harbors Made Safe Without Engineering.—The trial trip of the tng "Escort," bnilt at and intended for Coose Bay, snggests tbe facility with wbich our difficnlt harbors on the Pacific coast are made quite safe and essy of entrance, withont the necessity for great engineering undertakings. Coose Bay bss one of the finest coal mines in the world, adjacent to ship landing; and the principal difficnlty in the way of its rapid development, has been its dangerous bar. This has been overcome by the enterprise of Messrs. Howsrd & Pool, wbo have wisely pnrcbased tbe coal mines, and of Mr. Pershbaker, the present proprietor of several ssw mills in the vicinity. Thus, Hnmboldt Bay, Coose Bay, and the month of the Columbia, are not by any means the unpromising points, commercially, that they have become reputed to be, from the misfortnnes of ill advised or ill piloted sailing vessels. In estimsting the availability of harbors on tbe Pacific coast it is only necessry to take into consideration the proportion of days in the yesr when the bar breaks so violently as to endanger or incapacitate a steam tng.

Incombustible Buildings.—Signor A. Borgbi has been experimenting for four years with tbe view of removing the serions objection to the Burnett process which existed in tbe fact tbat the smell of wood prepared by it was intolerable. The process, as is known, consists in the nse of tungstate of soda for rendering wood and other snbstances incombustible. Signor Borghi, aided by tbe Italian government, bas, it is said, removed tbis objection, and tbns perfected the process. The new tbeater in Florence has all its wood work and timber prepared by the new process; and an attempt to set it on fire from the stage, which was made by way of experiment, failed. The formula is not as yet published by the Italian journals.

Darwinism in Germany.—Prof. Carl Vogt, the most popular scientific lecturer in Cntinental Enrope, has been giving an interesting conrse of lectures on prebistoric man at Antwerp, lately. His object is to show that, the fnrther back we go into the past, the less development there is in the human form. Everywhere in the prehistoric period we meet in man with characteristics bringing him nearer and nearer to the lower animal; prominent eyebrows, slanting teeth, flat chin, are always found in connection witb the earliest periods of the human race. Development of form has always kept pace with that of the brain, the size and weight of which are proportionate to the increase of the intellectnal faculties. In the ape, all the peculiarities of the skull and face are tbe frnit of advancing years; the new born creatnre has the appearance of a bnman infant. But a man cannot be traced back to the ape actually living; he descends with them from a common stock, from wbich they bave branched ont into three races: the orangontang, the chimpanzee, and the gorilla. According to Dr. Vogt, man nnites in himself certain characteristics of each of these branches, viz.: the brain of tbe orangontang, the skull and teeth of the chimpanzee, and the limbs of the gorilla.

Locher's Steam Plow at Oroville has been completed, and a pnblio trial was to have taken place on tbe 24tb inst., the results of which we look for with interest. At a private trial which took place on the 15th, tbe work is said to have been done in a manner satisfactory to those present. We are informed by Mr. Locher that bis plow both turns and pulverizes the soil in a very thorough manner.

Report of the Nevada State Geologist.—The report of the Nevada State Geologist, the Rev. Mr. White, has been sent in to the Legislatnre, at Carson, bnt is no yet published. We notice several extracts in the Nevada papers, from which we expect that the report will furnish ns with much valuable information.

We need scarcely tell our readers that it is the best mining and scientific paper published on the continent. *Arizona Miner.*

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Appleton S. M., M. & T. Co.—White Pine, Nev. Capital stock, $4,000,000; 40,000 sbares, $100 eacb. Trustees: Samuel Adams, E. J. White, S. C. Bradshaw, T. Stabl and John D. Dusheon.

Cliff Lode and Tunnel Co.—White Pine, Nev. Capital stock, $1,000,000; 10,000 shares, $100 each. Trnstees: G. C. Rogers, H. E. Green and Henry Schmiedell.

Cortez S. M. Co.—White Pine, Nev. Capital stock, $2,400,000; 24,000 shares, $100 each. Trnstees: G. C. Rogers, H. E. Green and Henry Schmiedell.

Tabasaca S. M. Co.—White Pine, Nev. Capital stock, $750,000; 7,500 shares, $100 each. Trnstees: A. K. P. Harmon, H. DeGroot, W. E. Dean, Chas. Hosmer and W. H. V. Cronise.

Crown Lode and Tunnel Co.—White Pine, Nev. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: W. B. Bourn, A. K. P. Harmon, Chas. Hosmer, W. E. Desn and H. DeGroot.

Ascendant M. & M. Co.—Capital stock, $1,300,000; 13,000 sbares, $100 eacb. Trustees: L. L. Alexander, C. W. Kinsman, D. McLaren, Albert Shepard and L. B. Drew.

Dundee S. M. Co.—White Pine, Nev. Capital stock, $1,000,000; 10,000 ahares, $100 each. Trustees: W. E. Dean, Chas. Hosmer, A. K. P. Harmon, H. DeGroot and W. H. V. Cronise.

Willimantic Silver Mining Co.—White Pine, Nev. Feb. 20th. Capital stock, $1,000,000; 4,000 shares, $250 each. Trnstees: James B. Johnson, H. W. Fortune, C. A. Uhrig, H. J. Stone and Fred Lux.

Daniel Webster Silver Mining Co.—White Pine, Nev. Feb. 23d. Capital stock, $1,200,000; 1,200 shares, $100 each. Trustees: Wm. Selby, C. A. Uhrig, H. J. Stone, J. D. Thompson and Andrew Jackson.

Treasure Hill Consolidated Mining Claims and Tunnel Co.—White Pine, Nev. Feb. 24th. Capital stock, $5,000,000; 50,000 sbares, $100 each. Trnstees: R. W. Heatb, P. J. White, J. H. Baird, James Hitchins and Geo. F. Maynard.

Treasure Hill Tunnel Co.—White Pine, Nev. Feb. 25tb. Capital stock, $2,000,000; 20,000 shares, $100 each. Trustees: C. W. Fnx, M. J. McDonald, A. Hayward, Frank Livingston and R. E. Brewster.

Five-forty S. M. Co.—White Pine, Nev. Feb. 25th. Capital stock, $1,200,000; 12,000 shares, $100 each. Trnstees: D. W. Taylor, H. F. Wheeler, J. M. Buffington, A. Averill and R. S. Miller.

Silver Terrace Mining Co.—White Pine, Nev. Feb. 25tb. Capital stock, $1,000,000; 10,000 sbares, $100 each. Trustees: J. D. Thompson, Samuel Hyneman, E. S. Gauer, E. M. Hall and Henry DeGroot.

San Rafael and San Quentin Railroad Co.—Feb. 19th. Capital stock, $500,000. Directors, A. Mailliard, S. V. Smith, James D. Walker, Jacnh Short, P. K. Anstin, L. A. Hinman and James Ross; President, A. Mailliard; Treasurer, James D. Walker; Secretary, Chas. Stevens.

Elevated Roadway for Velocipedists. Mr. Dana, of the New York *Sun*, one of the most expert velocipedists in that city, advocates a project to bnild an elevated roadway from Harlem to the Battery, to be nsed only by the riders of velocipedes. The *Scientific American* says: "By this means it would be possible to go from one end of Manhattan Island to the other in about an hour, making allowance for delays from stoppage and accidents. The proposed roadway ought to be at least thirty feet wide, upon an iron framework; witb a flooring nf hard pine. By all means let us bave tbe 'elevated roadway,' and let tbe sidewalks be kept clear for pedestrians, wbo are otherwise likely to be endangered by the carelessness or awkwardness of velocipedists."

The Exact and Natural Sciences.—Mr. Latham's lecture on this subject before the Young Men's Christian Association, on Tuesday evening last, was listened to by a large audience, and was highly appreciated. It was published in full in tbe *Herald* of Febrnary 24tb.

Engineering.

Important Telegraphic Scheme.—A bill is before Congress autborizing James F. Hall and associates to constrnct, at their own expense, a new experimental telegraph between Washington, New York and Boston, and to run opposition to the present lines on condition of charging but one cent per word.

The company propose to use the iron pole, a model of strengtb and beanty, of which there are over 400,000 in use in India. Instead of tbe present wire, they will use an "air cable," consisting of ten, perbaps fourteen copper wires, whicb will mske the cable about one inch in diameter. Esch wire is composed of four strands compactly twisted, separstely insulated, and again insulsted, so as to prevent any disturbances from atmospheric causes. The company bave given this cable the most thorough tests fnr over a year, and they find it is jnst ss reliable in stormy weatber as in fsir. They will nse their new machine, which at a low and reliable working test will transmit one bnndred words per minute (as rapidly as a very slow speaker) for each wire, or for a ten-wire csble sixty thonsand per bour. Their messages are sent and received on metallic bands, and when they have to be repeated it is not necessary that they bo re-written, but the receiving band is placed in tbe hopper of the delivering machine, and the message is off without delay, and with mathematical exactness. This can be repeated any number of times. The compsny own nearly all the tclegraphic inventions which have been made for the last five years.

Another Overland Telegraph Line.—Arrangements have been made between certain capitalists East and in this city, says the *Alta*, which will insure the construction of a telegraph line from this city to tbe East, making a connection witb lines on the other side running west from New York. It is considered that the enterpise will be a paying one. The line is projected to tonch all the paying ronte, incinding Virginia City, White Pine, etc.

Railroad Items.—The Virginia and Trnckee Railroad, on whicb ground was broken last week, is to rnn to Carson, it appears,—a direction opposite to that of the Truckee,—and it is stated that a number of other points will be "connected with" before it reaches the Truckee; for example, the wooded sectinn np the Carson Cañon. Two tnnnels are to be run, one at the head of American Ravine, of 600 feet. Tbe work of track-laying will commence at Carson, as that is the nearest point where ties can be obtained. I. E. James is chief engineer of the road, and H. M. Yerkington, superintendent. It is expected that the road will be completed and in rnnning order by November next.

The side tracks, switches, turn-table, water-tenk and passenger depot, at the Gilroy railroad terminus, are all in rapid progress, while the hallasting is being pushed forward with energy. Preparation is being made for an early reception of the passenger cars.

The tracklayers on the Central Pacific Railroad, February 20th, reached a point 567½ miles east of Sacramento, and were going ahead at the rate of 2½ to 3 miles per day. Some heavy cnts had been encnnntered in front, and the tracklsyers were crowding tbe graders. The company have on the otber side of tbe mountains a snfficient qnantity nf rails, spikes, etc., to lay 80 miles of road. This lot of material is depnsited at Reno, Wadsworth and other places on tbe road, and constitutes a sort of "reserve" to be nsed in case of a serious blockade in the Sierra Nevada Monntains.

The two o'clock train of the Ceotral Pacific Railroad took out, on the 23d inst., a large nnmber of sdditional tracklayers, the company emplnying all the men of this class they can obtain. They pay them $2 a day and board. The *Sacramento Reporter* says the company is determined to lay fnur miles a day till the road is completed.

On the 16th inst. the constrnction trains reached Independence Springs, 60 miles east of Elko. There was no more snow than in the vicinity of Anstin. At Cedar Pass, four miles west of the springs, the railroad company has a force of 800 wood choppers, and J. M. Dorsey bas 300 more. It is estimated that the cedar and nut pine timber of the locality will supply the wants of the road for a couple of years. The wood is now carried as far west as Winnemucca.

The interrnption of travel upon the Union Pacific road during the present winter, by reason of the snow, bas been very trivial, says tbe *Chicago Tribune*, and not more than thst experienced on the Northwestern Railroads. Overland passengers, however, report being snow-bound for ten days near the hight of land east of Green river.

When tbe railrosd is completed, it will take 48 bours fnr transit between Salt Lake and Omsha. Vice-President Durant says the road will reach Ogden City between the 1st and 10th of Msrch next.

Robebt L. Harris, C. E., late of the Sacramento and Vallejo Rsilroad, bas been engaged with a snrveying party in making a preliminary survey for the location of a railroad from Monterey to the Salinas river, nnder what is known as tbe Titus Hale franchise. Tho length of the road will be about 13 miles.

The *Stockton Gazette* of the 18th says: We are informed that next week the cars will commence running regulsrly from Sacramento to the Cosumnes, a distance of about 20 miles, where the Stockton and Sacramento stage will connect witb the railroad and transfer its passengers to tbe cars. This arrangement will shorten the time between this point and Sacramento several honrs, and be a great convenience to travelers.

The *Gazette*, of February 23d, says a surveying party, in the employ of the Central Pacific Railroad Company, with Capt. Stade at its head, commenced on that day tbe survey of a rnute for a railroad from Stockton np the San Joaquin Valley.

It is a coincidence wortby of note thst the Suez Canal and the Pacific Railway will be completed and open fnr service in the same year and at nearly the same date.

Suspension Bridge between New York and Brooklyn.—The Honse Committee on Post Roads and Canals reported in favor of bridging East river, between New York and Brooklyn, and the telegraph reports that a bill granting the right of way, has been passed. The bridge must be 130 feet high, with but one span, having no piers in the river. Its estimated cost is $10,000,000, and will take five or six years to construct it.

Nevada City Survey.—The Nevada *Gazette* says tbat the city trustees bave contracted witb H. S. Bradley to make a snrvey of the lands within the corporation limits. The contract price is $750, for which he measures every lot, and makes two maps on tbe scale of 80 feet to tbe incb.

The Quail Hill "Chemicals."—Some time ago we gave an outline of the results obtained at Quail Hill, where ore which bad paid only $4 per ton by amalgamation in the battery and on copper riffles, had been made to yield $32 of silver and gold in tbe pan. At tbat time we were not informed of the nature of the chemicals used, but we have since been told that they were merely quicklime and common salt—thirty pounds of each to the ton of ore. After the muller is raised and the qnicksilver put in, the pulp shonld be examined from time to time. A spoonfnl of it sbould contain a mnltitude of globnles of bright quicksilver; if there is no quicksilver, the pulp is not thick enongh; if the mercury is not bright, more lime and salt are needed. There is little danger of having too mucb of them. Cyanide of potassinm was nsed also, but tbe opinion prevailed that it was not needed with quicklime.—*Alta.*

Mining in China.—A Chinaman has come in, says a Hongkong letter writer, with the report that a certain hill, about seven li from Tan Yang, which last year at this time was supposed to contain coal, and for whicb some foreigners were then negotiating, has turned ont to contain gold and silver. The country people are said to be in excitement abont the discovery, and the place has been walled in to prevent depredations.

Causes of Explosion.—Tbe Hartford (Connecticut) Steam Boiler Inspection Company report for the month of Decmber 341 boilers examined externally, and 70 internally. In these, 168 defects, of which 32 were especially dangernns, were discovered. Fractnres, burned and blistered plates, incrnstations and corrnsions, safety-valves overloaded, blow-ont apparatus, water gauges, and pressure gauges nut of order, *stop-cocks between the safety-valve and boiler*, etc., etc.—were among these defects. All these boilers were in actual nse.

Continental Life Insurance Company, 203 Montgomery street, corner of Pine.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, February 7, 1869.

City Stocks.

The market for stocks other than mining has been remarkably quiet. Sales of Spring Valley Water stock were made at $68 50@69. A small amount of Santa Clara Co. bonds were disposed of at $76.

A meeting of the stockholders of the Sacramento Gas Company is to be held on the 30th of March next, for the purpose of considering the increase of the capital stock of said company from $500,000 to $1,000,000.

The returns of our local insurance companies to the Internal Revenue Department, for the month of January have been as follows, upon a currency basis of 75 cents to the dollar:

Pacific	$30,811
Union	42,109
Fireman's Fund	22,869
California	9,058
Merchants' Mutual	24,088
Occidental	12,532
Home Mutual	13,733
People's	17,130
Total	$222,341
Same time in 1868	158,573
Increase	$63,768

The receipts of the city railroads for this month of January have been as follows:

Omnibus	$22,216
North Beach and Mission	20,389
Central	12,564
Front Street, Mission and Ocean	7,849
Market Street	9,886
Potrero and Bay View	2,009
Total	$76,843
Same time in 1868	67,069
Increase	$9,774

Mining Share Market.

Few persons are aware of the mineral product of what is termed the Comstock Lode. It occupies a foremost place among the silver yielding regions of the world, and has proved a grand dispenser of material benefit to this State. From the date of its location and exploitation to the 1st of April, 1866, the bullion product of this lode amounted to $51,380,588. Since then the average annual yield has been about $11,000,000, which will make a total production of about $85,000,000 by the first of April, 1869. The cost of reducing the ore has been gradually lessened from $30 to about $20 per ton, at which latter figure it remains until superior and cheaper methods shall be discovered. Owing to mill facilities the Imperial and Empire companies, several years ago, were enabled to mine and reduce ores at an expense of $15 per ton. The claims upon this lode are too numerous to particularize; but from our voluminous statistics we select the Gould & Curry and Savage as fair samples. The first was opened and work commenced on it in June, 1860, since which time to November 30th, 1866, it yielded $13,626,871 in bullion, from 230,516 tons of ore, being an average of $59 02 to the ton; but the highest yield of this ore was from July to December, 1860, when it amounted to $156 62 per ton. In 1867 it decreased to $24 66 per ton, and at the close of that year the total bullion product of the mine was $14,282,876. During the year 1868 the receipts from bullion and ore sold only amounted to $95,285. The average yield of ore reduced was $18 14 per ton. The Savage mining company, from date of its organization to July, 1868, nearly seven years, shows an ore yield of 270,521 tons, from which was obtained $11,327,700 in bullion, equal to upwards of $41 per ton. Since the above period to the close of January, 1869, the bullion yield has been $1,183,389, making an aggregate production of $12,211,089.

Although the expenses which have been incurred by working the Comstock Lode have nearly equaled the value of its product, immense benefits have inured to almost every industry in the State from its discovery and exploitation. It has been a fountain of wealth to thousands beside its owners, its influence being felt far and wide, stimulating enterprise and facilitating operations in other fields of industry.

The new discoveries in Lander county, Nevada, promise to become valuable adjuncts to the Comstock Lode. The returns from that region, for the three months ending December 31st, 1868, show that forty-nine mines yielded 2,493 tons of ore, valued at $870,554 45, which is an average of $349 20 per ton, in currency. As these mines are still in their infancy we are not in possession of any very definite statistics in their regard; but all accounts agree in describing them as unprecedentedly rich. Whether they will match the endurance and steadiness of the Comstock Lode remains to be proved, although nothing has yet transpired to cast doubt upon the permanence of many among them. One thing is certain: They will attract a large immigration bent upon producing only the precious metals, and all their supplies must be drawn from this city. Like the Comstock Lode they must put new life into nearly all our industries, and command respectful attention from all classes. If additional expense attends the working of these mines it is more than compensated by the greater richness of its ores. With the possession of the Comstock Lode and the White Pine district, Nevada can flourish her silver sceptre in the face of all the world.

The transactions at the Stock Board were very fair for the week, if we take into consideration that no sessions were held on last Monday and Tuesday. Some stocks exhibit a marked improvement, and, as a general thing, the stock market is in a very healthy condition. We notice a considerable falling off in time purchases. At the close this market is not so strong, and, as a general thing, stocks are slightly off.

Belcher—closed at $30 50. They reached ore on the 200 level which assays $300 to the ton, but the deposit is not yet very large. On the 335 level they are still following up the ore, with strong hopes that it will turn out well. They have been successful in finding three feet of ore on the 335 level..... Kentuck gained rapidly within the past few days, rising from $217 last Saturday to $250 on the 25th, and closing yesterday at $238. Receipts of bullion for February account to the 23d foot up $30,248.

Hale & Norcross—ruled at $87@71, and closed at $74 50. On February 23d the quartz was about eight feet wide in north face, four feet of which is said to be very good ore, the balance being very low grade. The winze from the fourth to the fifth level is down twelve feet, showing about four feet of fair grade ore. No material change in the winze from the third station, or in the raise up from the fourth. In both places they find moderately fair ore..... Segregated Belcher improved to $13, and closed at $11 75. The drift inside the line of the Belcher ground is reported to look well..... Amador (Cal.) is in request at an advance, selling at $275. The reports from the mine continue very encouraging. On the 24th inst., the ore in the north face of the drift was six feet wide and of rather fair quality. In the winze from the fourth station the ore is about three feet wide.

Imperial—sold at $109@112, closing at $110. Resumed work in 1,000 level drift on the morning of the 25th, and at noon of same day on the 1,100 level. Previously had gone 115 feet northward on 1,000 level and 16 feet beyond the east clay.... Savage was in the market to a considerable extent at $71@65, closing at $67 50. During the week ending February 20th, it is reported, 1,400 tons of ore were extracted, valued at $50,000, which is nearly equal to $36 per ton. .... Chollar-Potosi was in very limited request at $165@169, closing at $167. During the week ending February 19th 830 tons of ore were extracted from the Blue Wing locality of this mine. This portion of the claim is reported to be rapidly giving out. In the new shaft at the 920 level the drift opened into a larger amount of quartz, but no ore is yet visible. On the 1,100 level drift work has been suspended, having reached the west wall. On the 22d inst. $15,640 in bullion was sent forward to the office in this city..... It is reported that the Justice and Independent has developed some ore. Sales of this stock have been made at $21@13 50, and at close realized $15.

Ophir—is in better request, improving from $40 50 to $42, and at the close selling at $41 25. The lower drift is now thirty feet in length. On the night of the 23d inst., they cut a clay seam from one to three inches in width, running north and south. The rock shows no change, and at present there is no water in the drift.... Yellow Jacket has been less active than last week, improving from $67 50 to $72 25, and closing yesterday at $71 75.

Match It.—Ay, Messieurs of the Faculty, furnish if you can from your repertory of medicaments, a compound or a simple substance that will produce the same beneficient results that the Plantation Bitters are producing in all parts of the United States, tropical America, and the West Indies, every day. What will this preparation do? Briefly, it will replace debility with strength, regulate the disordered liver, tone the relaxed nerves, arrest the progress of emaciation, restore the appetite, relieve headache, cure fever and ague, prevent the evil effects of unwholesome water, chase away mental gloom, and mitigate or remove most of the physical troubles peculiar to the gentler sex. Will any of the official preparations do all this, or *half* this? If so, how is it that the masses reject them all, and put their trust unhesitatingly in this widely advertised specific?

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Oldest and Best Mining and Mechanical Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 414 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, miner, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its Seventeenth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

Resolved, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.*

As an advertising medium throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money orders.

DEWEY & CO.,

Quarterly and Monthly Editions.

At the end of each quarter a large number of our weekly issues for the preceding three months are bound up in book form, which, by special arrangement, are placed upon the ferry boats and various steamers leaving San Francisco and other ports on the Pacific Coast, for free reading by the intelligent traveling public. The Quarterlies are also to be found in the principal libraries, depots, hotels, and free reading rooms of the Coast.

This, in addition to our Monthly Series and large weekly circulation, makes the Press the best and cheapest general advertising medium throughout the Pacific Coast. The value of advertising in our columns, however, is best determined by those who have tried it, and we respectfully refer to our patrons in that line. No paper in the United States can boast a better class, and no weekly paper on the Pacific Coast receives as large a sum for regular advertising, or has more constant or long-continued customers.

The best place to get every different variety of spectacles to be found in the market, is at C. Muller's, 205 Montgomery street, near Bush.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Feb. 16th: The workmen in the Globe tunnel on Thursday night struck into quartz and sulphurets, with an increase of water; indication of near approach to the deposit sought, or a branch thereof.

The Mt. Bullion tunnel is now running in soft rock, and the Manager hopes to strike the first ledge of the series as soon as April next.

The Star shaft is now down 75 feet, and a drift will be run from about this point to the old workings at bottom of incline.

The Banner mining property, lying adjoining the Morning Star ground, has been disposed of in London, and the work of opening up the same is expected to commence in early spring.

AMADOR COUNTY.

Amador *Ledger*, Feb. 20th: Work on the Summit mine is being carried on with vigor, and the prospect is splendid. They are now taking out rock that pays $30 per ton.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, Feb. 20th: A recent clean up in the claim located on Buena Vista Hill, yielded at the rate of $25 per day to the hand. A number of companies in the same locality are doing exceedingly well.

The 30-stamp mill belonging to the Angels Quartz Co., has again commenced crushing. On the Bovee mine the shaft is been sunk to the depth of 300 feet. Times are lively in Angels.

The correspondent whom we mentioned in our last issue as "evidently writing from Railroad Flat," seems to think that we intended to convey the idea that he was writing in the particular interest of that place, and endeavors to correct us. We will simply state that we gave his item verbatim, as it appeared in the *Chronicle*, and headed it as being evidently written at Railroad Flat, as no other heading appeared, and no other locality was given other than the particular description of Railroad Flat as given in our items. We have always taken a lively interest in the mines of Railroad Flat, especially since the Petticoat, Chemisette, and Balmoral lodes have been located. Our correspondent adds: To show the *Press* that I am not writing in the particular interest of Railroad Flat, permit me to inform that most excellent journal that the favored locality of which I wrote so hopefully, is quite dull at present. The heavy storms and more especially the recent fall of snow, has nearly closed all active business. Even the famous Petticoat had to succumb to the hopeful and chilling influence of the Storm King, and until within a day or two past, the mill has been idle. It is now, however, crushing away.

EL DORADO COUNTY.

Placerville *Democrat*, Feb. 20th: Work was resumed a few weeks since on the Pacific mine, and a quantity of rock taken out and crushed, the result of which was so encouraging as to induce the proprietor to erect a new 10-stamp mill, which commenced crushing this week, and is doing good work. We were shown a sample of rock from the dump pile, by Mr. Stevens, which was liberally sprinkled with gold. There is a large quantity of this class of rock taken out, ready for crushing. The main shaft is 300 feet deep. At that depth there is a drift running north 130 feet, from which the rock is being taken. The ledge is from five to six feet wide, and improves rapidly.

The Epley quartz mine, situated in our immediate neighborhood, continues to yield handsomely. They are now down 240 feet, but at present are crushing rock from a depth of only 100 feet from the surface. The lead improves in richness as they go down. It now varies from two to eight feet in width, and pays on an average $20 per ton.

KERN COUNTY.

Havilah *Courier*, Feb. 16th: Hammer & Denker have struck a young White Pine in the Belmont mine, Washington district, about eight miles from Havilah. We have been shown specimens recently extracted from the Belmont of surpassing richness. It will pay probably $800 to the ton, though the average is not so large. This is a new discovery, the old lead having "pinched out." There are also some other valuable mines in the Washington district, among which we may mention the Kohinoor, Nos. 1, 2 and 3, and the Occidental.

NEVADA COUNTY.

Transcript, Feb. 17th: Berg & Co. have located and claim all the waters of Rush Creek below the Excelsior Canal Co's ditch, for mining purposes. They have also located 200 ft. of ground on the creek, commencing above the dam of Drum & Co.

Feb. 21st: Davis & Co. have located 2,000 ft. on the Imperial quartz ledge, located on Worthington's Ranch on the Grass Valley road.

The damage occasioned by the breaking of the reservoir of the South Yuba Canal Co. at Blue Tent is so far repaired that an abundance of water can be furnished for mining purposes.

Feb. 18th: The pleasant weather has been a blessing to the miners. They have now abundance of water and are working in good earnest. Many new claims have started up in the county since the late storm.

Gazette, Feb. 17th: Alexander and Andrew Berry have located two claims of 100 ft. each, for mining purposes, on Rush Creek, commencing 200 ft. above the dam of Drum & Co., and extending up the creek 200 ft., including the bed and banks of the creek. The same parties have filed notice of a location of all the water running in Rush Creek below the ditch of the Excelsior Canal Co.

Feb. 20th: Philip Dahle has just erected a 3-stamp quartz mill at Rough and Ready, which was started up this week. It is situated near the Bunker Hill ledge. It was built for the purpose of working this ledge, which is owned by Dahle & Ebelin, who are engaged in developing it. The ledge averages about 18 inches in width, and the rock ranges from $9 to $30 per ton.

A large slide occurred in the McCauley diggings, near Rough and Ready, during the late storm. Some two or three acres of ground, to the depth of eight or ten feet, slid off, carrying 30 or 40 rods of the Squirrel Creek ditch.

Feb. 22d: A new ditch to bring water from the Malakoff ditch to Nichols & Whiteside's diggings, was completed some time ago, and an extensive flume across a deep cut was finished on Saturday. This flume is about 250 ft. in length, and a portion of the trestle work is 75 ft. in hight. Fifteen men have been employed upon it for nearly five weeks. The Malakoff Co. have recently lined their flume with new blocks, preparatory to obtaining a larger supply of water. They are now running three pipes, but as soon as water comes more freely they will have more pipes and employ a much larger number of men.

Grass Valley *Union*, Feb. 16th: The snow being on the ground much outside prospecting has been stopped. The regular mines of Grass Valley, however, continue to turn out pay ore in quantities to suit owners. The Eureka will not pay the customary dividend this month because the company have bought the Roannaise ground and paid therefor about $45,000 in coin.

The North Star continues to take out rich rock, and the part of the ledge they are now in appears to be of miraculous richness.

In the lower part of the county there is considerable mining, and with prospects of success. The Scandanavian Co. have contracted that 500 tons of rock shall be taken out at $2.50 per ton. The company will immediately put up three arastras, to be run by water power, and the man who builds the arastras has such confidence in the lead that he also waits for his pay until the rock yields it.

The Red Jacket Gravel mine, near the same place, also shows well. They have, undoubtedly, the same lead as the Smartsville district, and many say it is as rich as the claims at Smartsville and Timbuctoo. The Red Jacket Co. start up in the spring with high hopes for big pay.

Feb. 17th: Yesterday morning Findley & Co. shipped to San Francisco about $26,000 worth of gold.

The Idaho Mining Co. day before yesterday brought in the sum of $16,000, the proceeds of two week's run.

The North Star made a clean up day before yesterday, of over $10,000. The rock coming out now is especially good.

The Young Pines ledge promises to be a good one. The men employed there have found a ledge which is clearly defined and shows free gold.

The rock in the Garden City mine is looking well. They are down about 60 ft., and have a well defined ledge in the bottom of the shaft, from eighteen inches to two feet thick.

Grass Valley *National*, Feb. 18th: The editor, after visiting the Frank Morso mine thus describes it: The quartz has changed to blue ribboned rock, and looks very favorable. We broke open a number of pieces on the dump pile and not only found the color but struck several rich specimens. The rock is rich in sulphurets, which are worth $150 per ton. They are down about 150 ft. on the incline, and have 175 loads out now ready for crushing. The last lot paid $51 per load, and that now being taken out is of better quality. The stamps will be started by about next Tuesday.... The North Star continues to yield excellent rock which will average $30 per ton, although some of it is much richer. The mill runs 30 stamps, and 10 of Hendy's concentrators are in use for saving the sulphurets.... At the Shanghai a whipsidary is at work and some very good rock is being taken out. We had no difficulty in finding specimens of free gold on the dump. They will have a crushing before long. They have out about 18 or 20 loads.... With the exception of the above mine, everything looks quiet and deserted on Massachusetts Hill and vicinity which a few years ago so teemed with life and activity. There is yet abundance of gold, but disagreements between companies have prevented concert of action and hardness of the rock and the immense expense of pumping deter any single company.

A San Francisco company have located a ledge on Kate Hayes Hill, which is to be called the Crescent, and will commence work immediately.

EXCELSIOR.—*Transcript*, Feb. 21st: We learn that the Mohawk and Montreal Co. have struck a very rich ledge over four feet wide. The ledge was struck in the lower level, near the mill, on the 15th inst. The owners now consider that the permanency of their ledge is established.

Virginia *Enterprise*, Feb. 17th: Meadow Lake is pretty much deserted. The snow is about eight or ten feet deep. But little work in the way of mining is being done in Excelsior district.

PLACER COUNTY.

Auburn *Stars and Stripes*, Feb. 18th: W. H. Puffer informs us that a crushing of about 60 tons of rock from the Jenny Lind ledge, just made, yielded in free gold $30 per ton. It is estimated that the sulphurets will pay $500 per ton. This ledge is situated on Dutch Ravine, about one mile below Newcastle. It is believed that there are many ledges in the vicinity of Newcastle that will pay equally well.

SISKIYOU COUNTY.

Yreka *Union*, Feb. 13th: The miners on Humbug Creek are laying on their oars, at present, as the ground they sluiced off last year has been washed up and there has not been water enough yet this winter to enable them to commence ground sluicing again. The principal mining on this stream now is in deep flats or high banks, where it is necessary to remove an immense amount of dirt, requiring a large body of water to do it successfully and profitably.

Mining on McAdams Creek has been more successful during the past year than it has been for several seasons previous. Nearly all the claims worked have turned out well and some of them largely.

The Etna Mining Co. has not been doing anything in their claim for some weeks past, on account of the scarcity of water.

The claims in the Klamath river, near Cottonwood, did not do as well during the year as it was supposed they would.

Lash & Co. have now been running their tunnel on the Accidental, which is intended to strike the ledge 100 ft. below the surface, for three weeks, and have got in a little over 100 ft. They have still some 60 or 70 ft. to run. They are at the same time taking out quartz at a higher level—about 40 ft. from the surface. At this level they have extended along the ledge a distance of about 100 ft. and find that it averages in thickness about 2¼ ft.

Haislip's new diggings on the East Fork of Scott River, prospect well, and from present indications bid fair to prove the richest mines yet discovered on the headwaters of Scott River. Duffy & Co. last week picked up a piece of pure gold in their claim valued at $37, which is proof conclusive that coarse as well as fine gold abounds in these new diggings. A number of new claims are being opened with every prospect of striking as good pay as has been found in either Duffy & Co's or Magill's claims. There is an extensive country on East Fork that has not been prospected.

TRINITY COUNTY.

Weaverville *Journal*, Feb. 20th: Sutherlin, McMurry & Hupp, in Weaver Basin, are running a cut at almost right angles with the line of their flume to the low flat along East Weaver Creek. They expect to run across to the creek this winter, and will then have an opening of a 1,000 ft. face upon the pay streak, with a mile of bedrock ditch and flume.

Fox & Fox at Lewiston, are making their claim on the hill, back of town, pay well. P. Cronin & Co. are still working a low water claim on Jackson's Bar. Squire Musser, in the Frank Woods claim, has found a channel in the hill that has so far paid him $7 or $8 a day to the haud, in coarse gold, picked up while sluicing.

The miners on lower Trinity are complaining of the scarcity of water. Shaber & Co. are making from $110 to $150 per week.

The miners at Minersville are pushing ahead as energetically as the supply of water will permit. A few days ago John Weeden picked up an 8-oz. piece of gold on Mule Creek. Excellent prospects are obtained on Buckeye.

A telegram from Trinity Center dated Feb. 22d, says: A miner named Weeden, at Minersville, within the past week, has taken out over $5,000 in coarse gold—some of the nuggets weighing eight ounces. The ground worked is not over 20 ft. square. In consequence of this rich strike, considerable excitement has been occasioned and several companies are preparing to open claims in that vicinity.

(A later despatch confirms the report above given.—EDS. PRESS.)

ARIZONA.

Prescott *Miner*, Jan. 30th: Mr. Borger has completed his working tests of the Sterling mine. He has proven that the ores of the Sterling can be worked successfully by chlorination; that they are rich enough to pay exceedingly well, and, also, that the Sterling is a mine. A contract for tunneling 50 feet more into the mine has been let.

The Eureka mill, Walker's district, was running on Plymouth and Box Elder rock, Wednesday last, and from the looks of the plates and batteries, the rock was paying.

At Black Cañon, Big Bug, Lower Lynx Creek, the Placeritas, and on the Upper Hassayampa, the placer miners are working away, and doing well.

A party who recently arrived from Bradshaw mining district, brings highly encouraging news concerning the mines in Black Cañon Creek. Three of the seven companies now at work there were sluicing when the party left the creek, and making from $8 to $12 per day to the man. The other companies were cutting ditches, making sluices, and otherwise preparing for work. The bar owned by Behman & Co., is on the south side of the river, about one mile below Montezuma Bar. Before coming here, the company prospected it thoroughly, and Behman informed us that he would not hoard a man who could not make $10 a day in it. We saw several prospects which he had carefully kept separate—the poorest of which was 18 cents out of two pans. There is one channel in the bar, the dirt of which prospects 40 cents to the pan.

Jackson, Lovejoy & Co., at Lower Lynx Creek are piping away.

The companies engaged in mining in Big Bug district, are making from $5 to $10 per day to the man; those on the Hassayampa are also doing well.

At the Placeritas, near Walnut Grove, at Weaver, and near the Vulture mine, placer mining is being carried on, and those engaged in the business have been and are doing well.

About 20 tons of refuse rock has been crushed at the Eureka mill, on Lynx Creek but owing to the intense cold, which prevented amalgamation, they were unable to get the gold together.

Work on the Chase tunnel is steadily progressing, and the mine is growing wider.

BRITISH COLUMBIA.

The Victoria *Colonist* gives the following: The new mines at Suqwash, near the northern extremity of the island, are being rapidly opened. The Nanaimo Packet reports that the Superintendent, with his gang of laborers, has driven a tunnel some distance into the side of the hill, and that the coal ranks in quality with the best heretofore discovered on this island.

The indications of a "rush" to the Kootenay diggings are so favorable on the American side that two Oregon drovers are preparing to drive in 2,000 head of cattle for the supply of the gold-seekers.

COLORADO.

Central City *Herald*, Jan. 13th: The Whitcomb mill, Nevada, is now running on better ore than at any time since 1860, from the Forks lode. Its 12 stamps are constantly busy....Col. Tannett is now running 20 stamps of the Rocky Mountain Co's new 30-stamper on Bates ore. The ore vein has somewhat improved of late ...A quartz mill is being put up on Fall river with a view to crushing ore from Russell and Nevada.

We have the following from Nevada district: Wheeler & Vanderen have a 14-inch vein of galena in the bottom of their mine. Besides this, the mine is yielding a large

quantity of ore which is being crushed at the new Beverly & Koonce mill. It pays very well. The galena is about as pure as any we ever saw. Specimens will yield as high as 75 per cent., and an average of the galeaa vein will go as high as 60 per cent. We saw some remarkable cubes of lead this morning, which surpass anything of the kind we have ever seen, for size and singularity of shape.

A. M. Jones has got through the cap on the Hidden Treasure, which is situated near the Forks. He has struck a large body of very rich ore. It is thought to be the same as the California lode.

B. C. Waterman sold his last lot of first class ore to Prof. Hill for $172 per ton. He is building a new mill in Eureka, which will be ready to start up next week. It will have 15 stamps.

A consolidation has been effected recently, of the Ophir, Gilpin and the First National property, on the Burroughs lode, making 602 ft.

Same, Jan. 27th: From Clear Creek we have the following items: Rockwell has struck mineral in the Gilpin lode similar to that found in the McClellan.... The Equator has recently opened up better than ever.... The Mendota has now a two-foot crevice of solid mineral, worth from $100 to $800 per ton by fire assay.

The Terrible tunnel is now over 50 feet long, pregressing favorable. In the shaft 150 feet deep they have a wider vein and better ore than ever before. They have about 25 tons of assorted ore in the shaft house, worth $1,000 per ton.... The Brown, Coin, Lilly, Elgin, Quaker, Emmet, Benton and other lodes on Brown and Sherman mountains are being worked with satisfactory results. A large per cent. of galena is being found in the Brown, where they are now working.... At the Brown works the cupol furnace started up yesterday.... Huependen, Wolters & Co. will soon be ready to start three new cylinders.

Central City *Register*, Jan. 28th: We have been presented by Stanley & Stalker, with a beautiful specimen of arborescent native copper. It was taken from their claims on the California lode, Nevada district, and is one of the best Colorado specimens of native copper that we have ever received. The rock which carries this metal appears, from a casual examination, to be quite rich in silver.

Work has been shut down on the Bobtail mine, owing to insufficient means for pumping out the water.

A one-third interest in the Cliff lode at Georgetown was recently sold for $1,500.

From Sugar Loaf district we have the following: The Hoosier mine is looking very well—better than usual. The shaft is now 125 ft. deep, and in the bottom they have ore the whole width of the shaft. A cross cut has been started from the bottom towards the west wall, and they have good ore in that as far as they have gone. A level has also been started north from the shaft in which they have ore the whole width. The other mines in the district are nearly all idle at present, and but little prospecting is being done. Ward district is quite dull, the Ni-Wot mill and mine both being at present shut down. The Long's Peak mill is doing a little work on surface ores. The Hoosier mill was running one pan only on rich ores, but it was expected that one more Hepburn, and one Blatchley pan would be started in a few days. They have a good supply of rich ore out, and a very large amount is in sight in the mine that can be taken out as fast as it is wanted.

Denver *News*, Feb. 3d: A party just come down from Granite district, gives us the followiug: The Treasury Mining Co. are running their mill, 15 stamps, and crushing 2¼ cords of ore per 24 hours. The ore is from the Magenta lode, on which the shaft is now 120 ft. deep. It yields $95 per cord.... Partridge & Morrison's 9-stamp mill, has just finished a run of 2½ cords of ore from the Jessie Johnson lode. It was supposed the yield would not be less than $150 per cord. The ore was taken from a shaft 40 ft. deep.... Work is being done in a number of lodes, and considerable prospecting is being done, resulting in many valuable discoveries.

IDAHO.

Owyhee *Avalanche*, Feb. 6th: We were this week shown a large specimen from the Baxter mine, one of the handsomest we have ever seen; it is very rich in sulphurets of silver. The shaft is now down to a depth of 190 feet, and the lode is growing wider as it goes down. The pay streak, out of which this specimen was extracted, ranges from 18 inches to two feet in width.

New and rich deposits have been struck lately in the Poorman and in the Rising Star at Flint.

The Ida Elmore mill will suspend operations for a few days, in a day or two, for the purpose of making some alteration about the mill as well as the mine. The mine looks splendidly, and the ore is as rich and abundant as ever. They propose to sink the south shaft to a considerable depth before forming a new level; after which the mine will continue to furnish its accustomed flow of bullion.

The total amount of bullion assayed in Owyhee County during the month of January was $115,803.39.

Silver City *Tidal Wave*, Feb. 9th: Black's mill is running on Pickens & Edward's ore; a fine yield is anticipated.

Dalles *Mountaineer*, Feb. 12th: The quartz mills at Warren's Diggings have been running nearly all the winter and have been paying quite well. The placer miners have been able to continue their work all through the winter. The new quartz mill lately put in operation at Florence, crushing rock from the Davis lead, has been paying well.

Silver City *Tidal Wave*, Feb. 16th: The Poorman is now yielding ore that in quantity and quality is fully up to the standard of the famous mine in its palmiest days. Large quantities of ore are being taken from the level, 200 feet from the bottom of the main shaft, which is 300 feet deep. The rich vein matter in which gold predominates, is from two to four feet wide.

A force of 70 men is now employed at the Golden Chariot mine, and large quantities of glittering ore are being brought to the surface. The deeper and more extensive the mine is worked, the better does its immense richness become evident.

We have recently been shown several pieces of gold-bearing quartz of marvelous richness, from Peck & Porter's mine. The ore is similar in appearance to that of the Golden Chariot and Ida Elmore.

L. W. Greenwell is engaged in developing another mine immediately south of Peck & Porter's claim, on the same lode. Encouraging prospects are obtained.

Operations have been resumed on the Minnesota. The north shaft is now down 80 feet on the vein, which is yielding quartz that will doubtless pay largely for working.

MONTANA.

Helena *Post*, Jan. 29th: John Potter yesterday concluded the purchase of 200 feet on the Park quartz lode. The price paid we did not learn. Mr. Potter will immediately proceed in the development of his interest, and place sufficient quartz on the surface to commence.

The 12 mile ditch which is to carry all the water of McClellan's Creek into Upton's Bar and Maguire's Gulch, is now nearly completed. Six hydraulics will be in operation on Upton's Bar and Maguire's Gulch early in the spring.

A shaft has been sunk on discovery claim of the 10-Mile Mining Co., some 23 feet, and a gravel has been reached which contains gold to the prospect of ten cents to the pan. The gold is of a coarse nature.

William Nolan arrived last night from Cable City, bringing with him 329 ounces of gold retort, which amounted to nearly $8,000 in currency, being the result of one week's run of the Nolan mill. This mill is at present engaged on another run. The Hauer mill will probably be started in a few days. McCartney started for Cable this morning to provide means for a speedy delivery of quartz at this mill.

The Deer Lodge *Independent* has the following: Prof. Swallow's mill is now operating on quartz from the Nevin's lode. The mill is in fine condition and doing well. It constantly improves in condition.

The Pittsburg & Montana Mining Co's quartz mill at Georgetown has changed hands. We understand that active operations will at once commence, which will keep this mill actively employed.

NEVADA.

RUMBOLDT.

Unionville *Register*, Feb. 6th: Fall & Co. shipped this week, per Wells, Fargo & Co's Express, 1,500 ounces of fine bullion.

The Winnemucca correspondent writes: There are four companies at work in this district—the Wearmouth, Stars and Stripes, Accident and Pride of the Mountain. The Wearmouth Co. are now at work clearing out an old tunnel which had been run to the ledge some three years ago, which is about 150 feet in length, and opens the ledge 60 or 75 feet from the surface. Below this another tunnel has been started, which will cut the ledge 50 feet lower. A shaft will then be raised to the upper tunnel, and from that to the surface, which will thoroughly ventilate the mine and at the same time determine the value of the ledge. The company intend to thoroughly open the mine this winter, and build a mill in the spring, unless satisfactory arrangements can be made for shipping the ore to Swansea. One interest in this mine was sold last week to Dr. Hutchins, for $1,000.

The vein in the Accident mine is rather small, but is said to be exceedingly rich. A tunnel is in 60 feet, at the end of which the vein in the ledge is 15 inches wide, with ore that is said to assay as high as $800.

The Stars and Stripes, or Union Series, which consists of six ledges, is owned by a New York Company. This mine is more thoroughly opened than any in the district.

The Pride of the Mountain mine may be considered the "Eberhardt" of the district. It is owned by Buck & Kunkel, who are now taking out and sacking ore from three different tunnels, on which they readily get an advance of 50 per cent. of the pulp assay delivered on the platform of the freight depot at this place.

There are a number of ledges in this district, aside from those mentioned above, which will in all probability be worked this coming summer. Among the richest of them are the Grant, World, Ledi, High Star and Last Chance.

REESE RIVER.

Austin *Reveille*, Feb. 11th: Six bars of bullion, the product of ore from Leon & Co's El Dorado South in the district of Silver Bend, were brought to this city last evening.

The Manhattan mill closed on Saturday and will remain closed for several weeks. Cause, want of ore.

Feb. 12th: The stage which arrived from Belmont last evening brought into this city seven bars of bullion, the product of Leon & Co's El Dorado South.

The first consignment of bullion from Austin across the continent to New York city was made this morning by the First National Bank in this city through Wells, Fargo & Co. The shipment comprised seven bars produced from the ore of Leon & Co's El Dorado South, in Silver Bend district.

Feb. 13th: The second consignment of seven bars of bullion overland to New York city, through Wells, Fargo & Co., was made to-day by the First National Bank in this city. The bullion is the product of the El Dorado South mine in Silver Bend district.

Feb. 16th: We are informed by good authority that on Thursday last the vein of the Buel North Star of the Lane and Fuller Co., was uncovered of the great width of five feet, and that it contains a stratum of ore ten to twelve inches thick that is worth from $450 to $500 per ton, as shown by assays, and that the remainder of the vein will pay at the rate of $100 to $150 per ton.

We mentioned the other day the finding of a large and beautiful crystal of polybasite in the Buel North Star mine in Lander hill; and we saw yesterday in the cabinet in Boalt & Stetefeldt's office four fine specimens of tetrahedrite—argentiferous grey copper ore, or silver fahlerz, which were obtained from the same mine. These pretty, three-cornered crystals are called pseudo-morphous, being covered by a very light incrustation of copper pyrites, of fine yellow hue, closely resembling native gold, and very attractive to the eye of the novice.

Feb. 17th: By the stage which arrived from White Pine this morning six bars of bullion, weighing 592 pounds, consigned to the Bank of California, were brought into this city.

Belmont *Champion*, Feb. 13th: The mill of the Belmoot Co., last week finished a six-week's run on ore from Leon & Co's El Dorado South, and "cleaned up" on the 7th instant. The run comprised 343 tons of ore, which yielded 58 bars of bullion, weighing 53,605 ounces. The product of the ore is about $50,000.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Feb. 13th: We are informed that the Belcher Mining Co. have cut into a body of ore assaying $90 per ton, between their 300 and 400 foot levels. The deposit is said to be over 12 feet wide in places.

The total shipment of bullion from this city, last week, was but 3,025 pounds, valued at $89,423 86.

The Justice & Independent Mining Co., have started up again in good shape. They have two powerful engines and two new 11-inch pumps, capable of throwing 25,000 gallons per hour. The shaft has been pumped out and repaired to the bottom, a depth of 380 feet. The company now have in sight a large quantity of ore which will pay very well for crushing at the prices charged by the mills at the present time.

The new Ophir shaft is now down to a depth of 700 feet, at which point preparations are being made to start a drift. Workmen have been engaged for two or three days past in cutting out a station from which to open the drift, and drifting will be commenced as soon as this work is completed. The whole depth of this work is 725 feet, but the 25 feet below the station is counted as "sump." The company claim to have a front ledge, and one object in running the present drift doubtless is to ascertain if there be such a ledge.

WHITE PINE.

Austin *Reveille*, Feb. 8th: The stage which arrived in this city yesterday from White Pine brought five bars of bullion from one of the mills of that district.

Feb. 13th: A passenger who arrived in this city this morning from White Pine informs us that a severe storm prevailed in that district for two days previous to the departure of the stage, but that the snow was not deeper than it was in this city. The snow was preceeded by terrific wind.

Feb. 15th: The stage which arrived in this city from White Pine this morning brought five bars of bullion from one of the mills in that district.

A correspondent writes to the Virginia *Enterprise*, under date of Feb. 4th, as follows in answer to the question "Shall I come out?" put by a friend in this city: "If you could have the least idea of how matters stand here, you would not ask. Just imagine the wind blowing a perfect hurricane, the thermometer 10 degrees below zero and a dense fog that you can hardly breathe enveloping this city, and you will have some idea of a day on Treasure Hill. Add to this a place overcrowded with people, with no other occupation than standing around whisky-shops drinking whiskey—as the snow is so deep no prospecting can be done—and you have some idea of White Pine at the present season.

A correspondent writing to the Nevada *Gazette*, under date of Feb. 9th, says: The exceeding richness of some of the ore here is beyond question, and capitalists are investing in both mine and real estate freely, and paying prices for both that I do not think the prospects will justify. Most of the purchases of mines are made by speculators or stock gamblers, who are willing to take any risk, being, as a general thing, so situated that they can evade any loss that may be incurred, and at the same time reap their portion of any profit that may accrue. Some of the mineral deposits on Treasure Hill are of immense richness; but from my observation all the ore is found in 'beds or "pockets," there being apparently no fissure veins, although the deposits on Chloride Flat would approximate nearer to such than anything I have seen if the upheaval of the hill had left the strata of limestone standing at an angle of 30 to 40 degrees, instead of horizontal or flat, as it is. This hill I look upon as more favorable to the laboring man than any quartz district I have seen, from the fact that he can go to work with his own hands, and by sinking 15 or 20 ft. have as good a chance as any capitalists of striking rich ore, from which he may make a snug raise.

NEW MEXICO.

A correspondent writing from La Mesilla, New Mexico, to the New York *Tribune*, under date of Nov. 23d, 1868, says: Considerable excitement has been manifested here, lately, owing to the reports of the discovery of rich silver mines in San Andreas Cañon, about 40 miles from this place. The discoverer, a poor Mexican living in Las Cruces, accidentlly found the lode, and sank a shaft to the depth of 20 feet. On two or three occasions he has gone out there alone, and after an absence of several days, he has returned with his small native donkey loaded with about 300 pounds of ore. This ore was bought either by Lesinsky & Co., or Louis Roseuhaum; but, until within a very few days, the exact locality of the lode was unknown. On the 17th inst. a party left here to prospect San Aodreas Cañon. They returned yesterday, and report the discovery of silver lodes of fabulous wealth and magnitude. There is one lode of some 50 feet in width, which can be distinctly traced for several miles by the eye. The blossom rock which lies on the surface, and marks the direction of the lode, is pure quartz, and contains silver and lead in large and plainly visible quantities. Three hundred pounds of the ore, taken indiscriminately from the bottom of the shaft, have been assayed, and prove that the ore will yield $1,700 to the ton.

OREGON.

Dalles *Mountaineer*, Feb. 12th: A small party of prospectors left a few days ago for some place across the river, said to be about 12 or 14 miles from here, where it is said they have discovered placer gold diggings.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. O. YATES, California.
S. H. HERRING, California and Nevada.
T. O. ANDERSON, Nevada.

Resident Agents.

OAKLAND.—W. B. Hardy.
A. S Hopkins, No. 709 street, Sacramento.
WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, Feb. 27, 1869.

Notices to Correspondents.

IBERIA.—The chemical powers, as they are usually termed, of the voltaic pile, were first observed in association with the decomposition of water and certain saline solutions, by Messrs. Nicholson & Carlisle, in the year 1800. They were afterwarde more accurately investigated by Haisinger & Berzelius; and in 1807 Sir H. Davy communicated his celebrated lecture "on some chemical agencies of electricity" to the Royal Society, in which the electro-chemical powers of the pile were more minutely explained, and formed the basie of those brilliant discoveries with which he subsequently startled the ecientific world. It remained, however, for the late illustrious Farraday to explain much that had been left incomplete by former experimentere.

GOLD PEN.—Iridium and oemium were discovered by Smithson Tennant, a native of Yorkshire, England; a gentleman of moderate fortnne, but of great talent, amiahility and worth. Liks his great conntryman Cavendish; he was an exact experimenter, and also somewhat retiring. His experiments on the identity of the composition of the diamond and charcoal (1796) still remain models for eleganee and exactness.

THUNDER.—When a tree is struck by lightning, it often happens that it becomes nearly oompletely barked. Thie phenomenon is owing to the electricity taking that direction which forms the best conductor; which, when sap and moisture exist, is between the bark and the wood. The bark so stripped is sometimes found curiously spread round the tree in the form of a circle.

LIGNUM, Nevada.—Wood conducts heat much better with the grain than across it, that is better in a direction parallel with the fihers than across them. Dr. Tyndall hae not only confirmed this fact, but hns also proved that heat passes rather more rapid in a direction from the external surface towards the center than it does in the direction parallel with the ligneous rings.

B. S., Graes Valley.—It is not in all cases indispensably necessary that liquefaction should take place preliminary to crystallization, the depesition of a solid from the gaseons state sometimes tnkes place in crystalline forms. Iodine, nrsenious acid, sulphur, iodide of mercury, and camphor afford familiar illustratione of this fact.

BOILER.—With water and dilnte solutions generally, fluidity is accelerated through minute tubes, with increase of temperature. Water, for instance, at 113° Fah., has been found to escape through a tube 2¼ times as quickly as it did at 41° Fah.

RETURNING.—Wenre pleased to state that our W. B. Ewer, A. M., and his worthy family, left New York on the steamer of February 9th, and friends may anticipate their arrival in Snn Francisco next week, after an absence of six months.

The Petaluma Mastodon---Tertiary and Post-Tertiary Geology in California.

The ekeleton of the mastodon, discovered on Petaluma Creek by Messrs. Dickley and Gilmore, projected from a bank where the late storm had washed the dirt away. The tusk measures twenty-two inches in circumference, and the width of the skull is is nearly three feet.

A list of other localities in this State where the remains of the mastodon have been found, has been made out by Dr. L. G. Yates of Centervills, Alameda County, and will shortly be presented to the Academy of Sciences. The mastodon is not a rarity by any means in this State; though there are few well preserved specimens in existence, from the fact that the discoverers usually do not take the necessary steps to prevent them from crumbling to pieces. Specimens of the kind are frequently held at an extravagant price while they continue to be a novelty, and are then put aside and allowed to become worthless even to the finders. Their only value is to complete the fossil collections made by a few persone in this State who take an intereet in the study of paleontology. For any other purpose a mastodon bone is a piece of dead property. The best thing to be done with fossils alwaye, is to make a present of them to some geologist or amateur collector, who is able to appreciate them for what they may signify.

There are eeveral species of the elephant kind, found nearly everywhere over North America, from the Gulf of Mexico to Behrings Straits: *E. Americanus, E. primogenius*, together with the mastodon *giganteus* especially, the latter being found most abundantly over the northern half of the United States—representing the post-Pliocene age. This is the newest or fourth subdivision of the Tertiary, or modern period—of the Mammalian Age—heing eeparated like the Eocene, Miocene, and Pliocene subdivisions, by evident natural records left in the rocks all over the world. The mastodon in California marks the end of this Mammalian era, in which the nnimal kingdom, apart from man, may be said to have culminated, "for,"—says Dana—"the system then reached the highest grade of development presented hy the merely animal type, and brute passion had its fulleet display. Iu the era now opening, the animal element is no longer dominant, but Mind, in the possession of a being at the head of the kingdoms of life; nnd the era bears the impress of its exalted characteristic eveu iu the emaller eize of its beasts of prey."

In the bones of the mnstodon, geology records distinctly, in California, the origin and oomparative position in creation, of the human epecies. They have beeu found rspeatedly with marks of fire, and in association with implements of human manufacture, as well as with human bones—in the deep placer or gravel mines of post-Pliocene or "post-Tertiary" age in the foothills.

The post-Tertiary period had eeveral distinct features, marking so many subdivisions in it. These were: 1, The Glacial epoch, when, as Dana supposes, the monntains of the crust of the earth in northern parts at least, were elevated some thousands of feet, into colder regions, which created streams of ice everywhere like those of the Alps and of Alaska, the evidences of which are so universal to this day, and dug out the fiords of the northwest coast, etc. 2, The Champlain epoch, or epoch of river border and lake border formations, evidenced by lake, river, and ocean terraces, from Maine to California, and accounted for by a subeidence, again, of the crust, to its former position, euch as would enable the material of the terraces to be deposited under wnter. 3, The Terrace epoch, when the crust of the entiro contineut again rose slightly, and the terraces mentioned were carved by the rivers and lakes into their present shapes; a mnrked feature of the epoch being that there was an increase in the amount of elevation towards the north; as the terraces of Fraser River nre higher than they are at Humboldt Bay or farther south, the elevated sea beaches of the Arctic are higher than those of the St. Lawrence and of the New Englaud shores, and the upper terraces of the grent lakes higher than those south of the Ohio. 4, In the California gold mining eection in particular, and west of the Rocky Mountains in general, the *Volcanic* epoch, when the mountain river channels, ecooped out, and filled up again in one or another of the preceding periods not vary exactly defined, with auriferous gravel—a part of which, from its quantity, must have been formed during the Glacial period, and was perhaps dammed up and deposited to the remarkable depths disclosed in hydraulic mining during the eubsidence of the Champlain epoch—were overflown with streams of lava from Shasta, Lassen's and Downieville peaks, and the numerous other "sugar loafs" and volcanoes along the Sierra Nevada.

This lava period marks the end of mastodon life on this coast. All ths mnmmal species that lived up to the Volcanic epoch, the horses, buffaloes, tapirs, and the proboscis kinds, became extinct; while the oysters and shells of the sea outlived them, and are the same in the hills as those inhahiting the watere to-day. Moreover, mau outlived them,—hut not necesearily the Californian of that day. The great eruptions that created our highest mountain peaks, and covered the ancient river channels with lava and trachytie cement, were witnessed by human eyes, as was even the formation, perhaps thousands of years before, of the gravel deposits themselves, which succeeded the Glacial epoch. But at a time when all other living mammalia in this country appear to have bscome extinct, in the order and manner of nature as witnessed in geology, it is not impossihle that nearly entire races of mankind also may have besn forced to euccumh to like vicissitudes.

According to Dana'e calculations of relative time,—the only kind practicable nfter all between two eternities,—deduced from the thickness of observed geological deposits, the duration of the seveml ages of the Mollusks (Palæozoic) of Reptilee (Mesozoic) and of Mammals (Cenozoic or Tertiary) were 14 : 4: 3: thus bringing the history of the rocks down to the age of man; the duration, in the last mentioned, of the Tertiary propsr to the post-Tertiary, being 2 : 1.

We cannot do better than to quote from Dana in regard to the significance of the history of the Tertiary, and post-Tertiary periods,—the geology of which is applicable and interesting especially to man:

In the Tertiary, there was (1) the finishing of the rocky substratum of the continents; (2) the expansion of the continental areas to their full limits, or their permanent recovery from the waters of the oceans; (3) the elevation of many of the grent mountains of the glohe, or considerahle portions of them, through a large part of their hight, as the Alps, Pyrenees, Apennines, Himnlayas, Andes, Rocky Mountains, the loftiest chains of the globe,—a result not finally completed until the latter part of the Tertiary. In North America there occurred a small extension of the continent on the Atlantic and Gulf horders; n vast increase west of the Mississippi; a small rising of the land on the east and south, an elevation of 6,000 to 7,000 fe t in the Rocky Mountains (nearly the whole hight of the mass) and 2,000 feet or moro on the Pacific border.

In the post-Tertiary, the great events, in America at least, were (1) the excavntions of valleys over the lifted mountains and plains, and the shaping of the lofty eummits; (2) the distribution of earth and gravel, covering and leveling the rugged surface of the earth, laying the foundation of prairies, and filling the broad valleys with alluvium; (3) the finishing of the valleys and lake borders with a series of plains or terraces, aud the extension of flats along the sea,—a work completed in the age of Man. The excavation of valleys by running water began with the first appearance of dry land, and increased with ite extent. But the greatest augmentation took place after the lofty mountains had risen in ths course of the Tertiary period. The great gorges and cañons over a large part of the Rocky Mountains helow a level of 6,000 or 7,000 feet, and most of the deep channels occupied by rivers in other regions, then had their beginning.

There were great oscillations of level in the post-Tertiary as well as Tertiary; but (1) the post-Tertiary were mainly *high-latitude oscillations*, being most prominent over the colder latitudes of the globe, the cold, temperate and Arctic; (2) they were movements of the broad areas of the continents; (3) they brought no mountain ranges into existence.

Great rivers, glaciers, and icebergs were especially characteristic forcee of the post-Tertiary; and the ice accomplished what wae impossihle for the ocean. In no other period of geological history have eo large masses of stone moved over the earth's surface as in the Glacial and later epochs.

These post-Tertiary agencies were active everywhere over the continents, putting the finishing strokee to the nearly completed globe. There was a development of beauty as well as utility in all theee later movements. Those conditions and special snrface details were developed that were most essential to the pastoral, agricultural, and intellectual pursuits which were to commence with the next age.

This Petaluma mastodon helongs probably to the post-Tertiary deposit made up of beds of gravel, eand, clay and oyster shells, which rests nearly horizontnlly upon the upturned edgee of the Cretaceoue rocke, around Vallejo; at Bottle Hill, near Benicia; between Martinez and Bull's Head Point; on San Pahlo Bay between Point Pinole and the Emharcadero; on the San Rafael and Tomalee road, north of Tamalpais, and at numerous other localities arounnd the Bay of San Francisco. "The Valley of Petaluma"—eays Whitney—"extends through to the Ruesian River, is in the direct line with the Tertiary strata of the Contra Costa Hills, and is probahly an excavation in that belt, with metamorphic cretaceous and eruptive rocks on hoth sides."

THE AUSTIN REVEILLE is impatient on White Pine topics, and furnishes its readere with many a sarcastic article, the motive of which is amueingly apparent to outsiders. Out of a brief paragraph, in which we attempted to state merely a legal point at White Pine, it picks a eentence (inadvertently quoted) which makee ue responsible for the statement that Chloride Flat "has a stratum of rich ore, say a hundred feet deep." Ae it was evident from the connection that the word stratum was used in the sense of belt or zone, and merely a eupposed case at that, we are eorry that the *Reveille* could see in it only a "flat description" of that overrated conntry, which, thinks the *Reveille*, "may be appreciated ae n vnluable euggestion rsspscting the mining geology of White Pine, and so on."

A STUNNING METEORIO EXPLOSON took place near Bald Hills, at the head of Roaring River, Shasta Conuty, on the 5th inst. The Shasta *Courier* reports that the earth was felt to tremble and vibrate for several seconds after the explosion, nnd a flash of yellowish light illuminnted everything around. While the eounds were etill reverberating, an immense hall of blazing fire fell with great velocity to the earth, producing a shock. For several minutes after falling, the air was strongly impregnnted with a peculiar odor resembling that caused by heat generated by friction in heavy machinery.

QUICKSILVER NEAR VALLEJO.—The reports referred to in the PRESS, some time since, of a quicksilver discovery near Vallejo, nre repeated. The lead is a few miles northeast of Vnllejo, and tho owner of the land has sold a half interest in the vein for $1,000. The discoverer was Mr. J. D. Neate, who has been quarrying for the Benicia Cemeut Works.

Hafenegger Explosive Powder—Powerful Blasting.

The principal testa yot made with this new explosive componnd, took place jnst beyond Fort Point, on Friday of last week. Something liko a month since it was annonnced that this trial would take placo, bnt the timo appointed proved nnpropitions, owing to the high sea prevailing and washing over the rock.

THE FIRST BLAST.

The first rock blasted was round in form, about 35 feot diameter and 25 feet in hight, in its greatest dimensions. In this rock a 1¼-inch hole was drilled to the depth of 9 foet, and charged with 5 pounds of No. 2 (or what is termod weak) powder. The explosion was not a loud one, and the debris was not thrown in quantity to any great hight, or distance, but the exeention in the rock was remarkable, it being broken in overy direction from top to bottom.

SECOND BLAST.

The second and most powerful blast was fired in a rock near 40 feet in length, 25 fect high and 20 wide—irregnlar. It rested in a bed of sand, and the tide washed entirely around it. We wore present and saw the blast prepared in the early part of the day. The hole, 1¼-inch diameter and 10 feet dcep, drilled weeks before, had filled with water from the pouring of the surf over the entire rock. The wator being entirely swabbed out, a 1¼-inch cartridge several feet long was inserted containing the strong, or No. 1, powder. Into this, by means of a funnel and tube, was ponred the liquid which renders the dry powder explosive. Top of this was placed a small charge of the weak powder, which, by the power of its concussion, breaks the cartridge containing the strong powder, and exposes it to the fire which ignites the strong powder. No tamping was used. A redwood plug was inserted, grooved on one side to admit the common safety fuse used to explode powder No. 2. The charge was placed in about the center of the rock, the body of which is composed of hard cretaceons sandstone, bound partly by quartz. Notwithstanding our knowledge of the great strength of this new compound, the rock looked so large, the hole and charge so small, we could not persuade our judgment out of the belief that *this* blast at least would prove a failure. Unfeigned then was our delight, npon witnessing the discharge, to see the center of the rock rising in air, and nearly two-thirds of it parting and tumbling into tho water. Seams were rent through the entire mass. But a small portion was broken fine or thrown to any great distance, although the rock was well fractured in the center, the largest pieces,—some of them of nearly 20 tons weight,—were thrown from the edge. The rock is supposed to have contained about 1,600 tons—not 16,000, as our types erroneously stated last week.

Parties who have visited the largest rock since the blast, at very low tide, say a considerable portion is imbedded in sand, but that it was completely broken through.

It is questionable whether one hundred pounds of blasting powder could have been made to do equal execution to that wrought by the single charge of strong powder. To have done the work with common powder, would have required at least ten times the amount of drilling, and it is ths time and cost of drilling, rather than the consumption of powder, that renders blasting operations expensive.

About one hundred intelligent witnesses, including Col. Mendell, who has charge of the construction of the Government fortifications on Lime Point; Maj. Elliott, commanding U. S. Engineers at Fort Point, and other officors, miners, and members of the press, were present at these experiments, who seemed to manifest much interest and great satisfaction with the resnlts.

The American and forcign patents for this powder are held principally by the inventor, Prof. Joseph Hafenegger, an Austrian; Rudolph Herman, President of the Hafenegger Powder Company, and Frederick Weisenborn, Prussians.

Mr. Herman, the leading manager in tho enterprise, who had charge of the experiments, is owner of the Harbor View House, some three-quarters of a mile this side of Fort Point. He has appropriated a small portion of his National Shooting Gallery for manufacturing the powder and making experiments for the benefit of any interested parties who are desirous of fully understanding the merits of the powder. Ono realizes more clearly the morits of the powder in five minutes by seeing him mix and fire it, than by reading columns of descriptions. The compound is simple. It requires no laboratory to manufactnre it in when the ingredients can be obtained in large qnantitios.

The proprietors are very willing to exhibit their powder and its operation to all parties and interested persons, who are invited to call and see for themselves.

THE SAFETY

Of the powder is shown by Mr. Herman in his experiments. He takes an ashy-looking powder, containing three ingredients, which he pounds with impunity, and into which he thrnsts a lighted match without effect. He also subjects a white powder, looking like fine salt, to the same treatment with like result. Neither can by any means be exploded separately. He then takes a common No. 30 sieve and sifts the two parts together, when we have

POWDER NO. 2.

This powder is just as explosive—and no more so—than common gunpowder, and is nsed in the same manner for blasting. Its power is rated as 10 to 1 of first quality of common blasting powder; its cost as 3 to 1 of gunpowder. It can be nsed for rifle powder, creates less offensive smell, and blacking and fonling effect, than the article in common use. To show its effect, a bulk eqnal to a musket charge of gunpowder was placed in a slight hollow of an anvil, over which a 32-ponnd cannon ball was placed. The detonation was equivalent to the discharge of a 6-lb cannon, and the ball was thrown several feet in the air. The same amount of first quality rifle powder, fired in the same way, had no more effect than a flash in the pan of an old flint-lock musket.

One and a half ounces of this powder was placed in a water-proof cap box, and this cap box placed in an iron cylinder of 2-inch bors and 6 inches depth. Over this was placed an iron-bound lager beer keg of 75 pounds weight. The discharge sent the keg some thirty feet in the air. Two and a half pounds of blasting powder, placed in an iron mortar underneath the same keg and fired in the same way, resulted in less noise, but much more smoke and fire, succeeding in raising the keg but a foot or two.

The two prepared parts of this powder may be soaked with water and dried, without losing their properties or wasting in strength.

POWDER NO. 1

Appears the same color as No. 2, but it may be hammered and filled with live coals and it will not explode in any manner till after being saturated with the fluid—and then it may be fired by a fuse, spark, or fire applied in any way.

We believe no powder in use has ever exhibited power equal to this, and for extraordinary or heavy operations it seems to be the best thing known. It has not, however, been sufficiently operated to determine positively its greatest relative strength, as compared with other compounds. Its safety is shown in the fact that it cannot be exploded until the liquid has been applied, and all is nearly or quite ready for the discharge, and then it is only exploded in the ordinary manuer.

SELF-IGNITING MATCH.

The powder No. 2, which is commonly nsed by the same method as gunpowder, may be exploded, or paper or other combustible material may be lighted, by saturating it with a certain liqnid which composes a part of Prof. Hafenegger's invention. The time required for prodncing this spontanoous combustion is regulated by the composition of the liqnid. After applying the liqnid to the prepared match paper, we observed the flame in about one minnto.

Our faith in the ultimate snccess of this powder was greatly increased by our observations on the day of trial. The fact that ths No. 2 powder can bo used after mixing, the same as gnnpowder, will make it popular with the mass of miners, while the safety of storing it and transmitting it the same as any common article of merchandise, before mixing the two parts, gives it a great advantage over ordinary powder.

Wo think the proprietors are entirely too slow in manufacturing and putting the powder into market.

PASSAGE OF THE COPPER TARIFF BILL.—A telegram on the 25th announced that the protective copper tariff bill, which was introdnced and pressed mainly in the interest of the Lake Snperior miners, but also vigorously sustained by petitions from this State, has finally passed the Senate. The *Lake Superior Miner* states that President Johnson's personal assurance has been given that he will sign the bill. The bill was passed by a vote of thirty-eight ayes to twelve noss. Among the ayes were Cole, Corbott, Williams, Nye and Stewart. While the bill was yet pending, Mr. Ferry, of Connecticnt, charged that the movement to increase the duties was not in the interest of the copper-miners, but of speculators in copper stocks.

The Detroit *Tribune* says: "This assertion was contradicted by our Senators, and from our own knowledge we are able to corroborate their statements. Specnlators may have operated in stocks, and made the probable passage of the tariff bill the basis of their calculations. Be this as it may, the *bona fide* copper-mining interests must have relief, and their petitions, therefore, are based upon actual and crying necessities. If they do not obtain such relief, the Mineral Range of the Upper Peninsula will again become a wilderness."

NOMINATIONS FOR OFFICERS OF THE MECHANICS' INSTITUTE.—At a meeting held on Saturday, the 20th, the following gentlemen were put in nomination as tho regular candidates for officers of the Institute for the ensuing year: For President—A. S. Hallidie, manufacturer of wire rope; for Vice President, J. R. Wilcox, builder; for Treasurer, H. L. Davis, President California Trust Company; for Corresponding Secretary, J. H. Gilmore, moulder; for Recording Secretary, George Pardy, mechanical engineer. For Directors: George C. Hickox, of Hickox & Spear, bankers; H. P. Herrick, carpenter; H. C. Macy, architect; W. Bartlett, County Clerk; H. Kimball, of Bartling & Kimball, bookbinders; A. Cameron, stair-builder; Robert G. Carlyle, machinist. Tho election will be held on Monday, March 1st, from 12 M. to 9 P. M.

TERTIARY DEPOSITS IN CHINA.—Baron Richthofen has returned from Nanking and from his geological tonr through parts of Chekiang and Kiangsn. He reports tertiary limestones full of nummulites, overlying the carboniferous limestones near Ta-hu. In connection with similar deposits in South Europe, in the Himalayas, in Japan, and the Philippines, and probably also in Formosa, the fact is of interest. It is known that the tertiary deposits of China cover a considerable area, but hitherto limestone had not been noticed of that age.

YANKEE MECHANICAL "NOTIONS."—The clock factories at Bristol, Connecticut, are busy making "movements" for walking dolls. A New York firm keeps five hundred girls at work making the dolls. Automatic baby-swings and cradle-rockers are turned out in quantities at Bristol; and among ths new things is a self-winding clock,—operated by the chimney draft.

O. M. TAYLOR, who acted as agent—*for a very short time*—for this paper in the State of Nevada, last August, is requested to call at this office and attend to business mattera on thal account.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. TAYLOR, who acted as agent a brief time for this peper in Washoe, is requested to call at or address this office, without fail.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 116 Sutter street, Lick House Block, San Francisco. 6v13-3im

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

ACROSTIC.

Pain Killer is *worth* what it weighs, in gold,
All around the world are its praises told;
It will Cholera cure—scourge of southern climes,
No victim dies, who takes it betimes.
Keep Pain Killer—a true friend by your side,
It will cure Cough or Cold, or Colic beside;
Look out to apply it for Bruise or for Sprain,
Let it once be tried—"*twill be used again;*
Every word I am telling you, Reader, is true;
Remember that Pain Killer is *good for you.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.
REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. febim

Offices to Let.

Two convenient front rooms (No. 9 and 10) in second story of No. 423 Washington street, to let on favorable terms Apply at this office, up stairs, No. 414 Clay street.

STOCK CERTIFICATES
FOR
MINING COMPANIES
AND
MANUFACTURING CORPORATIONS
HANDSOMELY PRINTED
AT GREATLY REDUCED RATES
At the Office of the
Mining and Scientific Press
ALSO,
BLANKS, RECEIPTS
And STOCK BOOKS
In the most approved form.

Our experience is large in this line of printing, and we are bound to give satisfaction in prices and work.
DEWEY & CO.,
114 Clay Street.

PACIFIC
Rolling Mill Company,
SAN FRANCISCO, CAL.
Established for the Manufactnre of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.
The highest price paid for Scrap Iron. 9v14m9p

Crucibles.

The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
519 Front street, San Francisco
1v18-3m9p

$20,000 to $25,000.

A PRACTICAL SMELTER wishes to enlist capital to build a Furnace on a Mine of rich Argentiferous Galena at White Pine. From $800 to $1,000 a day can be cleared with ease. Security and best of references, etc., given.
Address, WM. F. HILTON.
7v18-1m9p San Francisco P. O.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators;

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continuat working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRATTON. A. O. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

WILLAMETTE IRON WORKS,

THE STUDY OF ALCHEMY IN CHINA.—At the October meeting of the Oriental Society in New Haven (Conn.) Rev. William A. P. Martin, of Pekin, read a paper on the "Study of Alchemy in China." After tracing briefly the connection between alchemy and chemistry, the paper proceeded to demonstrate that the origin of Eurcpean alchemy was to be sought in China. In support of this view the following considerations were adduced, and illustrated by citations from Chinese and other works:

1. The study of alchemy had been in full vigor in China for at least six centuries before it made its appearance in Europe. It did not appear in Europe until the fourth century, when interconrse with the far East had become somewhat frequent. It appeared first at Byzantium and Alexandria, where the commerce of the East chiefly centered, and was subsequently revived in Europe by the Saracens, whose most famous school of alchemy was at Bagdad, where intercourse with Eastern Asia was frequent.

2. The objects of pursuit in both schools were identical, and in either case twofold—immortality and gold. In Europe the former was the less prominent, because the people, being in possession of Christianity, had a vivid faith in a future life, to satisfy their longings on that head.

3. In either school there were two elixirs, the greater and the less, and the properties ascribed to them closely correspond.

4. The principles underlying both systems are identical—the composite nature of the metals and their vegetation from a seminal germ. Indeed, the characters *tsing* for the germ, and *t'ai* for the matrix, which constantly occur in the writings of the Chinese alchemists, might be taken for the translation of terms in the vocabulary of the Western school, if their higher antiquity did not forbid the hypothesis.

5. The ends in view being the same, the means by which they were pursued were identical—mercury and lead being as conspicuous in the laboratories of the East as mercury and sulphur were in those of the West. It is of less significance to add that many other substances were common to both schools than to note the remarkable coincidence that in Chinese as in European alchemy the names of the two principal reagents are used in a mystical sense.

6. Both schools, or at least individuals in both schools, held the doctrine of a cycle of changes, in the course of which the precious metals revert to their baser elements.

7. Both are closely interwoven with astrology.

8. Both lead to the practice of magical arts and unbounded charlatinism.

9. Both deal in language of equal extravagance; and the style of European alchemists, so unlike the sobriety of thought characteristic of the western mind, would, if considered alone, give us no very uncertain indication of its origin in the fervid fancy of the Orient.

A COAL FIELD ON FIRE.—The Louisville *Courier-Journal* publishes the following:

We learn that a great conflagration is now at the hight of its progress in the celebrated Millar coal mines, on the Monongahela River, at the mouth of the Youghiogheny, fifteen miles southeast of Pittsburg. The fire began sometime since, and great efforts have been made to extinguish it, but to no purpose. An attempt to check its career was made by the erection of mud walls and the pumping in of large quantities of water, and by this means the fire was partially smothered; but the heat became so intense and the pressure of gas so great that the walls were burst, and the flames are now sweeping onward with greater force than ever. The fire is spreading through the old mines at the rate of sixty yards per day, and it is feared the entire field may be destroyed. So much progress has been made by the flames that it is estimated that the cost of extinguishing them before they have spread over the face of a thousand acres will not be less than $150,000. Twenty-two loaded wagons and all the tools of the miners have been lost thus far. The Millar mines are carried on by A. Millar & Co., of which firm Charles Millar, of this city, was formerly a member.

The coal field over which this great subterranean deluge of fire is sweeping, is one of the most valuable on the Monongahela, and extends a distance of some eight or ten miles. It is difficult to say what will be the result of this undergrounnd conflagration if it is not checked very soon.

COAL IN MONTANA.—The coal mines near Dearborn, Montana, produce a superior article of bituminous coal, which is found much better than charcoal for welding iron or steel. A load brought to O'Bannon's in Helena, is highly spoke of by the *Post*.

HYDRAULIC MINING.—This interest is at its highest stage of activity throughout the State, in steady and unexcited but sure and paying operations. From Dutch Flat, for example, our correspondent "A. E. R.," under date of Feb. 22d, writes:

Another mill has made a run on the Blue Gravel lead at this place, and had a splendid clean up, taking out a large amount of gold. The Baker Boys' Company have been busily engaged in bringing dirt to the mill, and as it is brought to daylight out of the drift, the yellow particles may be seen in every car load; and it promises to eclipse all the former yields by a large amount. The Roanoke, a new set of claims, have made a run and cleaned up well. All of the numerous hydraulic claims around here, at Cañon Creek and Gold Run, are paying about their old amounts, viz., eighteen to sixty hundred dollars, for from twelve to eighteen days to the run. There is considerable excitement about the Champion quartz lode. Some of the parties who went up to the claims, report, after examination, that the rock generally is much improved, in fact, immensely rich. I saw rock that prospected $2,800 per ton.

"EXPRESSIONAL DENTISTRY."—A correspondent of the *Scientific American* says of dentistry and dentists: The most popular material used by the profession for six or eight years past has been vulcanite. It has been popular on account of its cheapness, and the ease with which it can be manipulated; and yet the result of the use of rubber has been to retard rather than advance the artistic part of dentistry. Art has suffered sorely from this cheap and easily made work, and nature smiles at our attempts to imitate her work with rubber and porcelain teeth in rows like soldiers in a ten cent lithograph. To be convinced of this, we have only to notice in crowds, on steamboats, on the railroad car, on the streets, everywhere, the many, many sets of glistening, regular artificial teeth worn; and when we can discern the artificial, the thing is proved, for expressional dentistry would so hide the art dame Nature herself would not suspect another's work."

A GOOD LITTLE THING.—It is only three months since Charles Nye of Elizabethport, N. J., patented a bag-fastener; and he has already received cash orders for over 80,000, and several offers of $10,000 for the patent, which he declines. He has established a factory capable of turning out 15,000 of the article per day. The fastener consists merely of a couple of small leather straps, united by a central buckle.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adopting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

New Inventions.

SUGAR MAKING ON A SMALL SCALE.—A recent invention for the evaporation of sugar bas added materially to the inducements for the manufacture of sugar on a small scale, by laborers or farmers who bave not the capital or inclination to erect large establishments. The new cane-mill bas a capacity of 1½ hogsheads a day. The principal feature is that the evaporator bas a copper bottom with a number of transverse channels through which the cane juice is caused to flow back and forth, boiling violently, until it reaches the last channel at the opposite end of the pan, when it is fully concentrated, and flows off a constant stream of liqnid sugar. It will enable operators to produce 10, 20, 50 or 100 hogsheads of sugar with the expenditure of a few hundred dollars for a complete and perfectly manageable outfit.

EARTH EXCAVATING AND DITCHING MACHINE.—The *Denver News* describes a new earth excavator and ditching machine invented by Nelson Plumb of that city. It consists of a revolving cylinder, on which are secnrely fastened obliquely across it two rows of teeth, or shovel plows by which it is proposed to break up the earth. In addition to these on the cylinder are double rows of boxes, which catch the dirt and by means of a spring operating within the cylinder throw it in any direction required. It is proposed to propel and operate the machine by steam, placing the engine on wheels behind the cylinder.

Mr. Plumb thinks their cost will be about $2,500, and that they can be propelled at the rate of ten feet per minute, excavating dirt at a cost of about two cents per yard.

NEW WOOD SPLITTING DEVICE.—The Sacramento *Record* says: We were shown yesterday, by Matthew Cooke, of this city, a new style of wood-splitting wedge, for which he has filed a caveat, and applied for a patent. It consists of a bar of cast-steel, abont fourteen incbes in length, sbarpened at one end, to admit of its being driven into timber. Above this wedge, about three inches from the end, is a chamber for the powder. From tbe top of this chamber to the head of tbe bar is drilled a hole; througb this, when the wedge is driven into position for a blast, fuse is introduced by a rod, which not only holds the fuse in position, but by means of a set screw renders the charge air-proof. The effect is said to be terrible, no log being as yet strong enough to blow the blast.

INDIA RUBBER SPONGES.—A new European invention is an imitation of sponge made from india rubber. The imitation is stated to be perfect in appearance, but much softer than the real sponge, and its power of absorption, owing to its elastic quality as well as its durability, is said to be much greater. It has the advantage of being shaped into any required form without loss, and its softness is not impaired by the process.

IMPROVED ROTARY ENGINE.—Messrs. Salmon Brothers have completed the model of an improved rotary engine, of double action—reversible. It is a very simple machine; so simple that any one can be an engineer wherever it is used. It will be applicable to locomotives, or steamboats; and we predict for it a leading place in that catalogue. The model is finished and will go on to Washington in a short time.—[*Oregonian, Feb. 13th.*

LAND TRANSPORTATION.—Jaime Lopis Alfaro, a citizen of Aguascallentes, Mexico, has petitioned tbat Government for a patent for a new invention devised by bim for the transportation of freight and passengers by land. He claims to be able to propel wagons and carriages by steam or expanded air over public highways without the use of rails, *i. e*, over common roads. Another invention claimed by him in the same petition, is, well balanced two-wheeled vehicles, adapted for general use, drawn by horses or other animals.

IMPROVED HOP KILN.—Daniel Flint, of Sacramento, has invented a new bop kiln, whicb is believed to require less time and less fuel than the ordinory one. The hops are dried without turniug and removed at once without breaking, by means of railroad tracks on which the drying shelves rest, to a store room to cool. To avoid the necessity of bailing the hops before they are properly cooled, there is a partition across the store room which makes two bins, so that the hops can be boiled out of one, while the other is being filled. Other arrangements for cooling evenly and working with economy of labor, are attacbed to the hop house.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. M. S. S. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR FEBRUARY, 1869.

The following Steamships will be dispatched on dates as given below:

February 6th—GOLDEN AGE.....Capt. E. S. Fornsworth, Connecting with ALASKA, Capt. Gray

February 14th—COLORADO.....Capt. Wm. H. Parker, Connecting with RISING STAR, Capt. King.

February 22 d—SACRAMENTO.....Capt. A. West, Connecting with HENRY CHAUNCEY, Capt. Connor.

February 27th—MONTANA.....Capt Wm. H Hudson Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship JAPAN, Captain George E. Lane, will be dispatched on THURSDAY, February 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Resources and Developments.

SILK.—Mr. Nowman, of San José, has fifteen silklooms at San José, and two of them are at work weaving dress silk.

FIGS.—Dennen and Lasscle have taken up 160 acres of land in the foothills, in the neighborhood of Bugby's vineyard, and are engaged in setting out a fig orchard, a vineyard and a large number of fruit and mulberry trees.—*Folsom Telegraph.*

CORK OAKS IN CALIFORNIA.—Mr. J. H. Lick, Lick's Mills, Santa Clara County, Cal., planted acorns of the cork oak in 1858, and now has 85 trees, from 15 to 20 feet high and from eight to 10 inches in diameter. This would indicate that the climate of California is very favorable to the growth of this valuable tree.—*Vallejo Recorder, Feb. 23d.*

NEW ROAD FROM SALT LAKE TO MONTANA.—A number of the most enterprising citizens of Virginia City, Montana, contemplate forming a company for the purpose of constructing a wagon road from that city, via Henry's Lake, to Taylor's Bridge, on Snake river. It is said that this proposed new road will shorten the distance between Virginia and Salt Lake, or the railroad, fully eighty miles; while the route selected is reported as otherwise far preferable to the one now traveled.

THE NORTHERN TIMBER BELT stretching along the coast north of San Francisco, (says the Russian River *Flag*) for a hundred miles, and further, is a belt of redwood and pine timber from twenty to forty miles in width, nearly every stick of which is available to mills now running, or to eligible sites where mills will at some future day be erected, from whence the lumber can be sent to sea. There are no good harbors along this part of the coast, but, excepting in the winter season, vessels can anchor or moor and load in perfect safety anywhere.

PROSPERITY OF PUGET SOUND.—Business of all kinds on the Sound, say our exchanges from that section, is becoming very lively. The Land Office is doing a large business. For the month of January there was sold for cash 6,744 acres; located under the Homestead Act, 1,860 acres; final proofs upon homestead claims, by five years residence and cultivation of the same, 1,977 acres. Thus it will be seen that the Puget Sound country has taken a start, and there is little doubt that before another decade of years that country will contain one of the largest and most flourishing cities on the Pacific coast.

A GREAT GRAZING COUNTRY.—A gentleman just in from Elko says that the region of country surrounding that place is the finest for grazing purposes that he has seen in the State. He says no finer or sweeter beef can be found anywhere in the world than that upon which the Elkoites daily feast. The bunch-grass is in many places three feet high, and loaded down with seed, which is said to be more nutritious than barley, and horses and cattle are very fond of it. There are immense herds of cattle scattered through the country. Major Bradley, formerly of Stockton, Cal., has 15,000 head of cattle in that region, scattered about in droves of from 1,000 to 1,500 head. The hills for miles and miles are said to be alive with cattle.—*Enterprise.*

ALASKA RESOURCES AND ENTERPRISES BY SEA.—White Pine, says the *Bulletin*, may take the land lubbers, but the skippers have got Alaska and fur-bearing seals on the brain. As it is now conceded that no bill will go through Congress granting any trading monopolies, wide-awake parties are taking advantage of the prospects, and within a day or two every schooner which is sound and seaworthy enough for the voyage, and which could be procured, has been taken up for the Alaska venture. The owners say very little, but are very busy. Whaling, fur trade, barter with Indians, anything in the way of a commercial venture in the region of Alaska, is now the rage.

PHYSICAL DEGENERATION OF THE PARISIANS.—Dr. Raoul le Roy, who has made the matter a special study for years, says the *physique* of the inhabitants of Paris has been, of late years, distinctly deteriorating. One cause of this is the enormous increase in the use of tobacco and alcohol. The consumption of the latter has exactly doubled since the year 1825. As to tobacco, in 1832 it produced a tax of 28,000,000f; while in 1862 the consumption of tobacco brought into the government a sum of 180,000,000f. In 1852, 200,000,000 cigars were smoked in Paris, whereas, in 1867, the number increased to 761,625,000.

White Pine Items.

TELEGRAPHIC despatches are now received in this city from Hamilton direct.

SANGUINE people, says the *Sacramento Union*, believe that emigration to White Pine District will reach 25,000 before the middle of June.

SOMETIMES for a whole week together, Treasure City is wholly above the clouds, and the top of Treasuro Hill seems an island in mid ocean.

THE present population at White Pine is estimated at 6,000 to 8,000. Real estate speculation occupies the attention of a good many at present.

LETTER WRITERS, and all the Nevada papers are already canvassing the merits of a dozen or more new districts east of White Pine. Much that is known, however, is kept secret, with a view to further prospecting; and little can be said of their value at present.

THE altitudes of prominent localities at White Pine, have been taken with the aneroid barometer; but it must be remembered that the aneroid is very unreliable at such altitudes. Let tho observations be taken properly, with two cistern barometers, and repeated at least half a dozen times before making calculations.

BITUMINOUS shale, which burns freely, even in an open air fire, and is supposed to overlie a bed of genuine coal, has been discovered 1¼ miles east of Hamilton, and a claim has been located by parties in Hamilton and San Francisco. The shale is of the same character as that at Elko, and will serve for fuel for generating steam.

THE business of driving tunnels into the bowels of Treasure Hill is likely to prove especially active from this time onward, not less than a dozen of these important enterprises having been projected, four or five being already under way. In one of these tunnels, that of the Treasure Hill Company, a vein of exceedingly rich ore has already been struck, while in another, ore of a much lower but moderately good grade has been reached. These tunneling operations are becoming very popular here; as it is generally believed, they must result in great and almost certain success.

AN Elko correspondent of the *Bulletin* writes: Wells, Fargo & Co. intend to run two stages daily from Elko to White Pine. Their overland stages, which have been running for the last four months from Argenti, consisting of some 12 coaches and over 100 head of horses, arrived at Elko on Monday, the 15th, the remainder of the running stock going *via* Austin to Jacob's Wells, and from thence will stock the portion of the road nearest White Pine. Hughes & Middleton's accommodation line has also commenced running, and their line is in some respects superior to the Overland. Andy Poland & Co's opposition is another very good line. They are at present running tri-weekly, but will start a daily through coach shortly. This firm have also an excellent Saddle Train on the same road, which seems to be well patronized. The Pioneer Line owned by Len Wines, and run in connection with the Pacific Union Express Co., does not fall short of the others. It is currently reported here that the Idaho line of stages, belonging to Hill Beachy, will commence running from Elko early next Spring.

IMPROVED INNER SOLES
—FOR—
BOOTS AND SHOES.

Those who have worn Baggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the conception principle has been hit upon and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. These points connect the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also, to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 15 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article ever invented. CHARLES K. HARLINO, Stationer.

Patent Elastic Ventilating Soles—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, $1. By mail, postage paid, $1.25. For sale by PATRICK KELLY, No. 327 Sush street, San Francisco. 3v1tf

GRASS VALLEY, Dec. 2, 1868—*Messrs Dewey & Co:*—Having received the patent for Symons & Co's Tossing and Refining Concentrator, through your Agency, we return our sincere thanks to you for your unrivalled success. Yours, respectfully, SYMONS & HARRY.

Read and Subscribe.

With the advantages of past experience, the increased patronage and friendly support of the intelligent and progressive readers of the Pacific States and Territories, we are confident in asserting that the new volume of the MINING AND SCIENTIFIC PRESS, commencing with 1869, shall be in all respects superior to its predecessors. Of the past, we will give the written

OPINION OF OTHERS:

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

MINING AND SCIENTIFIC PRESS.—This excellent scientific journal has entered upon its eighteenth volume.—*Chico Courant, Jan. 15th.*

THE *Mining and Scientific Press* should have an extensive circulation in every mining community on the Coast.—*Placer Herald, Dec.* 19.

W. FRANK STEWART is Dewey & Co's accredited agent for the Patent business in this city, and will attend to their affairs in that specialty.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—This journal is devoted to mining and scientific researches, and has been conducted with great ability. It has been greatly enlarged and improved.—*San Jose Patriot.*

THE MINING AND SCIENTIFIC PRESS has become almost indispensable to the miner and machinist, and is well deserving of the patronage which we are pleased to learn it receives.—*Mariposa Mail, Jan. 10th.*

TO ALL wo may wish to obtain a thorough knowledge of the industrial resources of the Pacific Coast, the PRESS will be found a valuable paper.—*Oakland Transcript.*

THE PRESS is a credit to the State, and is fast gaining in popularity. It commends itself to all classes, and we hope many in this section will become subscribers.—*Pajaronian.*

THESE gentlemen not only print a first-class scientific and mining journal, but are also trustworthy Patent Agents, and doing much towards the inventive business of this coast.—*San Jose Mercury.*

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette.*

NEW VOLUME.—The MINING AND SCIENTIFIC PRESS has entered upon another year's work looking improved and promising. This paper is devoted to the interests of the scientific world, and to the miner and mechanic is almost invaluable.—*Gilroy Advocate.*

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

THE MINING AND SCIENTIFIC PRESS commenced a new volume with the new year. It is a credit to the State, and to the mechanic or miner, is a great source of valuable information. It has every appearance of prosperity, and we hope it may continue growing in wealth and influence.—*Pajaronian.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

WE CONSIDER the MINING AND SCIENTIFIC PRESS the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

A VALUABLE PAPER.—For many years after the American settlement on this coast, a journal devoted entirely to mining and scientific interests did not exist. Vast sums of money were expended, or rather squandered, by capitalists and others, for lack of proper practical and scientific information about the mines and their developments. This necessity has been fully met by the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., at No. 414 Clay street, San Francisco.—*San Jose Mercury.*

MINING AND SCIENTIFIC PRESS.—We look upon this paper as one of our most valuable exchanges, in fact it deservedly stands at the head of all publications embracing mining, scientific and mechanical subjects, and contains much miscellaneous matter of interest, and is a gem of neatness. The PRESS is published by Dewey & Co., San Francisco, and at its present low price of five dollars per annum, should be patronized by every one, but more especially by miners, mechanics and inventors who wish to pursue their avocations with intelligence and economy.—*Tidal Wave, Idaho.*

A USEFUL PUBLICATION.—The MINING AND SCIENTIFIC PRESS, published at San Francisco by Dewey & Co., is a publication valuable to all classes and indispensable to miners and inventors—the patents for nearly all California inventions having been secured through the Patent Agency of the proprietors of that paper, and the inventions themselves brought into notice through its columns. We are glad to learn, from Mr. Wm. H. Murray, the traveling agent of the paper, who dropped in upon us Monday evening, that its merits are so well appreciated; and we unhesitatingly commend both the paper and its gentlemanly agent to the confidence and patronage of scientific and practical men of all classes and every occupation.—*Solano Herald.*

New Mining Advertisements.

Glenwood Mill and Mining Company, Greenwood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1869, an assessment of twenty-five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, Room 11, No. 431 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the second day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-sixth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.
Office, 424 California street, San Francisco. feb27

Star Creek Mining Company.—Location: Storey District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of February, 1869, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of March, 1869 shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the nineteenth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HORACE MORRISON, Secretary.
Office, N. E. cor. Front and Jackson streets.

N. B.—The assessment levied on the seventeenth inst. has been rescinded, by order of the Board of Trustees.

feb27

Mining Notices—Continued.

Cholk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of January, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E C McComb	30	12½	$25 00
E C McComb	99	2½	5 00
Martin White	5	150	300 00
H W Hall	33	25	50 00
John R Mead	49	25	50 00
J H Pearson	64	2½	5 00
Wesley Henderson	67	100	200 00
Alpheus Ingle	71	5	10 00

And in accordance with law, and an order of the Board of Trustees, made on the thirteenth day of January, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on Monday, the eighth day of March, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, 37 New Merchants' Exchange, California street, San Francisco. feb20

Chloride Mountain Tunnel and Mining Company.—Location of Works: White Pine Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of February, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 615 Kearny street, San Francisco Cal.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the tenth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAMES RICE, Secretary.
Office, No 615 Kearny street, San Francisco. feb13

Golden Rule Mining Company, Tuolumne County, California.—Regular Bi monthly dividend (No. 18) of the Golden Rule Mining Company, of Tuolumne County, Cal., of 2½ per cent. per month, or fifty cents per share, is now declared, and will be paid to the Stockholders on and after the 26th inst. Office, 432 Montgomery street, Room No. 5.

J. B. RUSSELL, Secretary.
W. T. ROSWORTH, President.
A. S. PRIVER, Superintendent of Mine. feb20

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpina County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of January, 1869, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of February, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the seventeenth day of March, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. jan30

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1869, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 426 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth (5th) day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth (30th) day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N VAN SICKLEN, Secretary.
Office 426 Montgomery street, San Francisco. jan30

North American Wood Preserving Company.

Location of Works: San Francisco, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fifteenth day of January, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John L Samuels	not issued	300	$300 00
George W Dent	1	400	400 00
Henry S Dodge	not issued	200	200 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of January, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 430 Montgomery street, San Francisco, Cal., on Monday, the eighth day of March, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, 430 Montgomery street, San Francisco. feb20

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's in ferior make additional charges, subscribers must have agents settle the same.

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has overrequired repairs. The constant and increasing demond for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular dow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powdor, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to exaoine these pans and setlers for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,
Iron, Brick and Wooden Buildings,
SHIPS, STEAMBOATS, STAGES, CARS,
AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Aspholtum used. All work guaranteed. Orders punctually attended to.

2tv17-qy J. WEICHHART, Proprietor.

PATENT
Boiler Scraper and Tube-Cleaner.

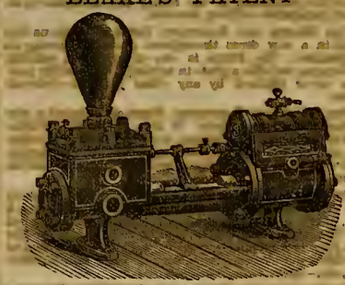
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their internal surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tubo the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. P. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances: it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

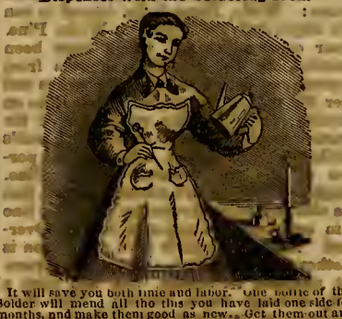
Novelty and Usefulness Combined.
Wilson's Prepared Solder
Dispenses with the Soldering Iron.



It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over tire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, Is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc. etc., and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18-1y

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Preservation of Timber with Sulphate of Copper.

The following communication dated Boise City, I. T., February 4th, 1869, on this subject, is of practical interest:

EDITORS PRESS:—In your issue of 23d ult., is an article touching on the preservation of wood, headed "N. Y. Society of Practical Engineering." The process there referred to is similar to one for which my grandfather held a patent in England and France; and as it is very simple and also very effective, and the patent is long since passed away, I will give the general particulars for the benefit of those of your readers unacquainted with it. The article used was sulphate of copper in the proportion of one pound of sulphate to eight gallons of water. The ordinary process was almost boiling the timber to be prepared, for from one to three hours in the solution and then plunging it into cold water. A section of the wood then showed the sulphate to have been driven into the very center of the timbor. Canvas and other like material was prepared similarly, by steeping in the solution for an honr or two. A captain of a vessel bound to Martinique thus prepared one of his anchor stocks, and on arriving at Martinique, (where the "*terredo navalis*" abounds) ussd two anchors, one with a prepared stock, and the other a new, sound, but unprepared stock. The vessel lay there at aochor for several months, and on weighing the unprepared stock, it was found to be entirely riddled, and almost destroyed by the "*terredo navalis*," whilst the prepared stock was untouched, and a microscopic investigation showed that it was proof against the insect. It has also been used for railway sleepers, with the greatest success. The value of this mode of preparation is its cheapness as well as its perfect security against rot. I have seen poplar wood thus prepared, buried for a year or two in rotten sawdust; when it was taken up it was quite sonnd, whilst unprepared wood placed with it, was quite destroyed by rot.

Wood, etc., can also be prepared by simply steeping it in cold solution for from three to five weeks, according to its size. Material thus prepared is also almost incombustible. H. W. O. M.

CHICKORY WORSE THAN A CHEAT.—The common adulterant for coffee is chickory. The use of chickory is openly acknowledged in some places, and even defended by grocers on the score of health and economy. We have medical testimony that chickory is extremely injurious to health. Dr. Hassall says that its frequent use produces heartburn, cramp in the stomach, loss of appetite, acidity in the mouth, constipation with intermittent diarrhœa, weakness in the limbs, trembling, sleeplessness, a drunken clondioess of the senses, etc. Again, it is the opinion of an eminent oculist in Vienna, Prof. Beer, that the continual use of chickory seriously affects the nervous system, and gives rise to blindness from *amaurosis*. Its use ought, therefore, to be discouraged, and grocers who sell it for coffee ought donbly to be put nnder the han.—*World.*

CAMPTULICON.—This substance is much nsed in England (but is only of late introduction into the United States) as a substitute for carpets or oil cloths, especially in public libraries and churches, as it deadens the sound of footsteps to a remarkable degree. It is made by a combination of powdered cork and the poorer qualities of india rubber, and is painted or ornamented on the surface like oil cloth. A convenient application of this substance is for cleaning knives, and is made by covering a strip of wood with it; then sprinkling the surface with the cleansing powder, and rubbing on the knife. The surface does not wear away, and the result is very satisfactory.—*Iron Age, Jan.* 28.

NATURAL GAS.—In Erie, Penn., there is a large manufactory of workers in brass, where the machinery is driven and the buildings lighted by the gas from an unproductive oil well. For more than two years the proprietors have brought the gas, by means of 3-inch iron pipes from an unsuccessful oil well 1,200 feet distant from the manufactory, and used it for fuel for their boilers and as lights for their works.

BEES AND WATER.—The American *Bee Journal*, in referring to an instance where a swarm of bees settled upon the head of a horse standing in front of a church, and the owner, who went to them was stung senseless, says that all the difficulty could have been obviated by the use of cold water sprinkled upon them.

PLEASURE ANALYZED ACCORDING TO SCIENCE.—A writer in the *Quarterly Journal of Psychological Medicine* contribntes a monograph on pleasnre, one of the first attempts at summariziag and explainiag existiag views on the snbjects. Describing pleasurc as that which is agreeablo to us, he acknowledges the difficnlty of definiag it. The essenco of the state of pleasurs is nothing more than a negation implying that whatever is positively discordant with our conscioasness must be disagreeablo to us. The contrast of pain is not pleasure, neither is the contrast of pleasnre pain. They aro both properly contrasted with indifferonco. It is easier to point out the sources of pleasuro, and these are, according to the writer we refer to, five. 1, an instinct satisfied. 2, a desire, a propensity, an appetite gratified with the appropriate material. 3, the special senses snpplied with the objects adapted to meet the elective affinity which seeks and accepts them. 4, a discomfort or annoyance, a harassing or a disagreeable condition removed. The writer adds a fifth source, but he is, nevertheless, prepared to find it disputed. It is certain diseased states of the organism.

CEMENT FOR LEATHER.—Of many substances lately brought very conspicuously to notice for fastening pieces of leather together, and in mending harness, joining machinery beltiag and making shoes, one of the best is made by mixing ten parts of sulphide of carbon with one of oil of turpeatine, and then adding enough gutta percha to make a tough thickly-flowiag liquid. One essential prerequisite to a thorough unioa of the parts consists in freedom of the surfaces to be joined from grease. This may bs accomplished by laying a cloth upon them and applyiag a hot iron for a time. The cement is then applied to both pieces, the surfaces brought in contact and pressure applied until the joint is dry.

TEST FOR WINE.—According to a German chomist, a very simple test to determine whether wine has been colored artificially or not, is furnished by adding powdered superoxide of maaganese to the suspected liquor, shakiag them together for a quarter of aa hour, aad then filtering. If the liquid be then light colored and traasparent, the contrary is the case.

DEWEY & CO.,
American and Foreign Patent Agents,

Messrs. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, the only well-established successful Patent Agents west of the Rocky Mountains, give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skilfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thoroughly throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Drawing School
—FOR—
APPRENTICES.

MR. FREDERICK HELLERT,

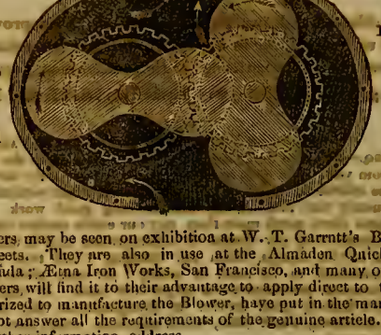
An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is living thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.
1v18.tf

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

Eleventh street, between Folsom and Howard.

GALVANIZING.

Also, Anti-Friction, Alloys for Journals, Type and Stamping Metals, Tinners and Plumbers' Solder, Etc.

☞ The best price given for the most rebellious or refractory ores. Ores and minerals assayed and analyzed. 4v16-3m

G. W. STRONG,
ASSAYER AND WORKER OF ORES,

No. 10 Stevenson street, near First, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms. t4v16gr.

MEUSSDORFFER,
HAT MANUFACTURER
And dealer in
Hats and Caps
AT WHOLESALE AND RETAIL.

635 and 637 Commercial street.....San Francisco.
125 J street.....Sacramento.
Corner of D and Second streets.....Marysville.
72 Front street.....Portland, Oregon.

Our wholesale House, 628 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

Contributions for our Cabinet.

No. 360.—Miargyrite, from the Rising Star mine, Flint, Idaho. Fahlerz, or gray argentiferous copper, is found in the upper levels, and the miargyrite at greater depths. It is easily distinguished from fahlerz by its giving a rusty red streak, and from ruby silver by its gray color. Presented by Guido Kustel.

No. 361.—Aphanite, from a dyke which crosses the vein containing the above, but which appears to be of older formation than the vein. Guido Kustel.

No. 362.—Iron amalgam, from the working of fahlerz at the Rising Star mine.

No. 363.—Gold in banded quartz, from the Pacific mine, Placerville, out of a drift 300 feet below the surface; one of the first quartz mines worked in El Dorado County, or in California, having been worked for over two years by the present manager, Mr. Stephens. In drifting from the main shaft, 300 feet deep, at a distance of 85 feet north, a "horse," in miners' parlance, was encountered; but within the past two months the workmen have been "raising on the ledge," and at a hight of about 20 feet a fine ledge developed, carrying five to eight feet of pay ore, working over $18 per ton at the last run. This fixes the existence of a large body of good ore.

No. 364.—Diallagite (carbanate of manganese), from Penitencia Creek, Santa Clara County. J. H. C. Bennett.

No. 365.—Asbestus, from near Montezuma, Tualumne County, where a large depasit is found in talcose slate. Presented by W. O. Sleeper.

DANGEROUS COAL OILS.—At last something has been done in New York towards the checking of the outrageous frauds which have been practiced upon the public in the matter of kerosene. Although the law distinctly declares the manufacture or sale, for illuminating purposes, of oil which is inflammable at a less temperature than 110° Fah., to be a misdemeanor, punishable by fine and imprisonment, it is notorious, not only that oil imperfectly freed by distillation from the lighter oils is sold, but even that same dealers actually *purchase*, at a low price, these light oils from the conscientious refiners, and *add* them to heavy oils, which are then sold for domestic use! A recent case of the fatal burning of a girl, has brought up the matter. On investigation before the courts, the oil in question was found to burn at 80° Fah., instead of 110°; and to vaporize at 68°, whereas that point should be at least 96°. The coroner very properly,—says the *Gas Light Journal*,—"held the manufacturers of this explosive compound, Reisser & Co., of Williamsburgh, to bail in the sum of $5,000 each, and the retail dealer from whom it was purchased, Schoonmaker, in the sum of $2,000, to await the action of the Grand Jury."

The *American Artisan* says that seventy-eight samples of kerosene from as many different retail dealers in New York, were tested by the Board of Health. "Of these one ignited at a temperature of 18°, while a large majority of the others showed a burning point between 44° and 100°; very few indeed going higher than the latter, and only one specimen in the entire list possessing all the characteristics essential in an absolutely safe burning oil. Other samples were subjected to analysis to determine the relative proportion in them of the dangerous fluids, and some of these showed the presence of benzine, gasoline, naphtha, etc., in quantities varying from six to ninety per cent. The specimen containing the last-mentioned percentage was about as appropriate to the burner of a kerosene lamp as a coating of nitro-glycerine would be to the top of a blacksmith's anvil.

DROP LETTERS.—It should be distinctly understood that drop letters, when sealed, require but ONE CENT postage in towns or cities where there is no free delivery by carriers.

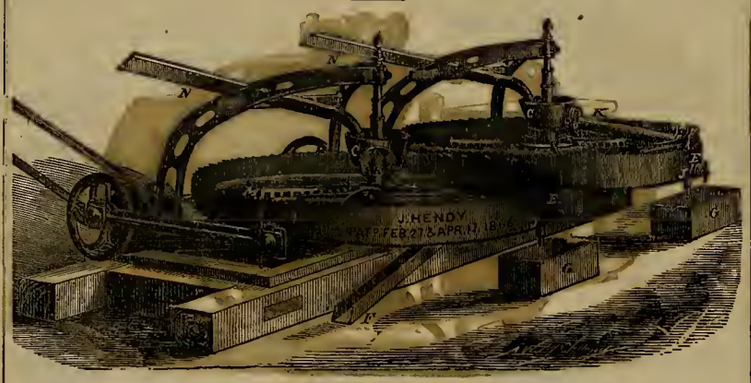
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical applicatian, has improved bis Concentrators until they naw stand unrivalled, far in advance af any yet braught to public notice.

By recent alterations in the patterns far these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $950, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Office at Union Iron Works.

DEWEY & CO.

U. S. AND FOREIGN

PATENT AGENCY

FOR THE PACIFIC COAST.

Office, No. 414 Clay Street,

SAN FRANCISCO.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but, when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

Confidential Advice.

We invite consultation (in person or by mail) regarding new inventions, for which we make no charge. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests guarantee, and the thousands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

Advantages of Our Agency.

Inventors on the Pacific Coast can sign the papers at once, and save at least two months' time in securing patents through our office. When desirable they can visit and give us personal explanations—better than written instructions.

We assist in bringing valuable inventions to the general notice of the public through out the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

From long experience in the business, and an intelligent and thorough understanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents*.

We guarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

Information for Inventors,

Printed in circular form, containing list of Government and other fees, sent free.

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and foreign patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

California inventors should beware of placing their inventions and money in the hands of persons not well known as honest, responsible and capable.

Patent Office Reports.

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801 to 1845, and full files of scientific papers containing illustrations and list of U. S. Patent Claims, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

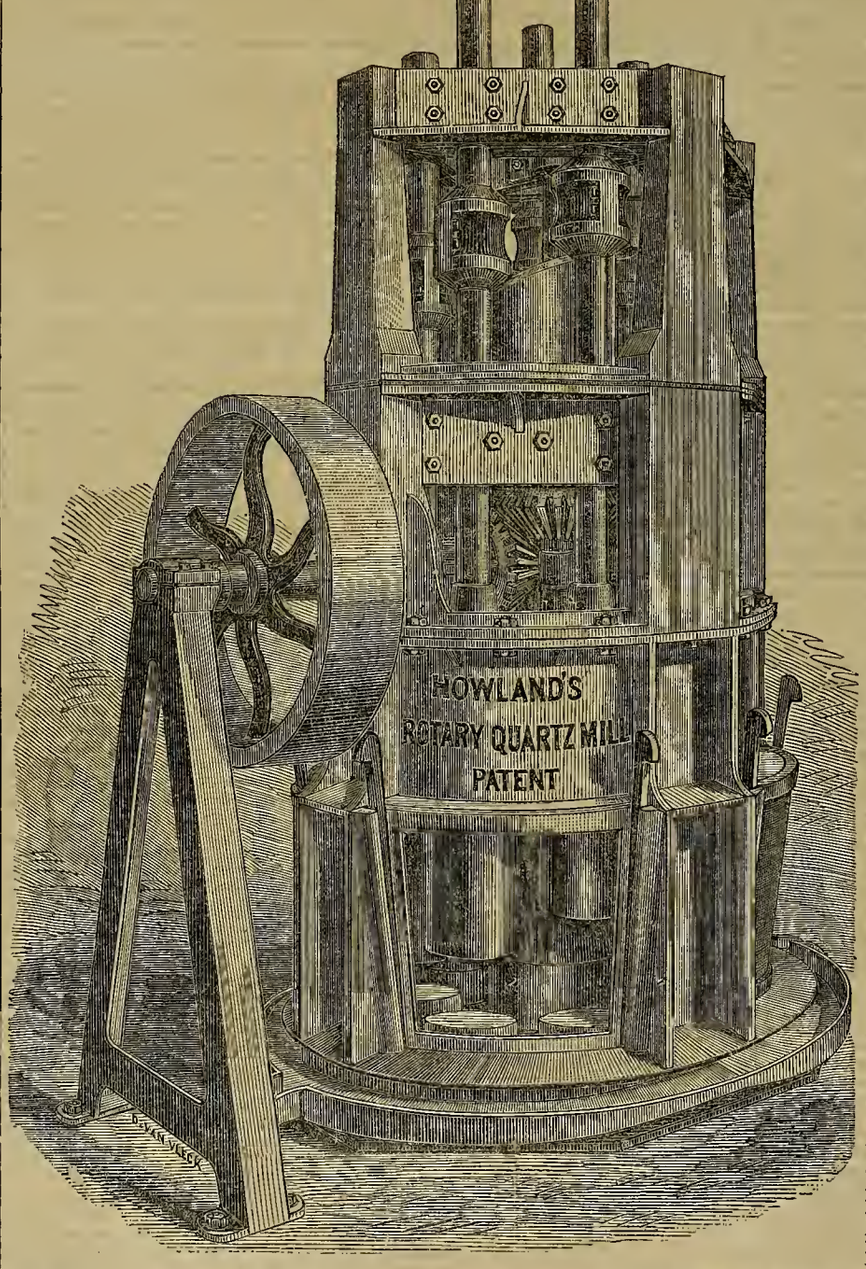
The Howland "Rotary Battery."

This invention, of which we present an illustration, recommends itself especially to our attention at the present time. It is conceded throughout the world that the American quartz milling machinery developed and produced in the foundries of San Francisco, is superior to anything of the kind in use in any other country. The stamp-mill is really the simplest of all machines, the commonest, and the most ancient of devices for crushing coarse substances fine; and its application has been very extensive in the arts outside of mining. In economy and efficiency, and for general application, it has held its ground against all subsequent inventions of our inventive century having the same purpose in view.

But the lumbering old wooden quartz mill of the Erz Mountains, though very cheap and durable,—and not by any means unworthy of consideration to-day for distant mountainous regions possessing water-power *minus* capital,—was not the thing for Washoe. Mechanically ingenious Americans who had roamed around the world before trying silver ore reduction, machinists, ex-sailors, and jacks of all trades, took up the stamp-mill the moment that there was "money in it," and made out of it a perfect machine. The smooth-working, and durable iron framing and shafting; the rotary stamps, adding a grinding effect to that of stamping; and a score of other practical details, soon made out of the Washoe stamp mill as pretty and as thorough a piece of working machinery as any one could desire to see. The truth of modern industry asserted itself here again—that steam and iron are the true and the most economical agencies of development wherever they can be advantageously applied. Ever since the palmy days of Charley Strong's management, accordingly, the mill has been everything with us,—our ores are "milled," and the metallurgists are "millmen."

The circular battery is a progressive step in the construction of the stamp-mill; and like the improvements shown in the efficient and elegantly-working Washoe quartz mill, the conception, and the peculiar trait evidenced therein, are eminently American in their character. First, ricketiness and inefficiency were overcome, as far as practicable. Now we add to the principle of the stamp-mill the perfection of simplicity and economy in the method of applying the elevating power to the stamps; the greatest possible quantity of screen surface to each stamp, the screens being the outer circumference of a circle—an important point, as millmen will recognize, especially in dry crushing, for which this mill is particularly adapted, though we believe not inferior to the ordinary one for wet crushing; the greatest economy of space, compactness and completeness, as issued from the foundry; and besides, if properly constructed to avoid jarring, also of durability. Another peculiarity of the circular stamp-mill is, that in wet crushing with quicksilver in the battery, it serves at the same time as an amalgamator, in creating, by the successive falling of the stamps, a current of fluid pulp round the circuit of the dies, which keeps the quicksilver and the ore in constant and perfect agitation, and contact.



The circular stamp mill has stood the test of practical operation at the Gold Hill mill during seven years, and is highly spoken of in several certificates which have been shown to us. In the new mills, one of which was recently mentioned in the PRESS, and is now on its way to Grant District, east of White Pine, there is more metal than heretofore in the mortar or base, and the leakage, jar, loosening of bolts, and wear of guide-boxes, heretofore complained of, are obviated by simple devices, such as wood-packing, etc. The claims in its favor are that it costs one-half less when set up and ready to run—viz., $1,800 and $2,800 for 8 and 12-stamp mills, weighing 12,000 and 18,000 pounds respectively, plus the freight, and one or two days of work in setting up—and that it requires less power than the ordinary mill.

In explanation of the engraving, it is scarcely necessary to add that there is a central revolving shaft driven by the bevel gear seen in the middle, having two triangular or wedge-shaped arm-attachments, which elevate and drop the stamps in turn, two (opposite ones) at a time. The feeding is from the center, the rock being shovelled in, or brought on automatically, as may be preferred.

REMARKABLE WALL SPRINGS of immense depth and varying level, are not uncommon throughout Nevada, and are to be accounted for as being natural artesian wells. The change of level in one of these situated perhaps a hundred miles east of Austin on the old overland route, is said by the station-keeper, to have a marked connection with the direction of the wind. As applying to particular seasons, or to continuous winds, this fact could be easily accounted for. Another of these wall springs is on the Humboldt and Honey Lake road. This is a perfectly circular spring, one hundred feet in diameter, and of unknown depth; from which flows a stream of about one hundred inches of the purest water, in which are thousands of small fish. If nature forms artesian wells in Nevada, how much may yet be done for that country in a similar manner by art? Many a way-worn and thirsty miner may profit by the hint so strikingly furnished him. Some of the dry barren soils of Nevada have been found the richest in the world, under moisture.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press.

Mechanico-Astronomical Cause of Geological Changes, and Earthquakes.

It would seem that the following simple circumstance in the physics of astronomy,—furnishing a mechanical explanation of geological changes not otherwise sufficiently accounted for, and at the same time a very possible constant cause of earthquakes,—could not have been overlooked by the cosmogonists, from Laplace down; yet we do not remember seeing or hearing the point of our correspondent heretofore advanced. The writer is known to our readers as having furnished us, not long since, with a method of obtaining perfect crystals of gold artificially:

Editors Press:—I propose to set forth a few ideas in relation to geological changes and earthquakes, which I have not yet heard advanced. We are living upon a ephere which revolves around the sun,—not in a perfect circle, but with an orbit of an elliptic form; and at the same time it is making 365 revolutions per annum, upon its own axis.

Now the question naturally arises, does one motion affect, or have any influence, upon the other? I cannot but think it does. Thus, as it passes from the flat side of the ellipse to the ends,—or in other words, from a long curve to a short one,—the two forces embodied in the earth must necessarily have a twisting effect—the orbit motion on the revolving motion,—consequently gradually changing the position of the poles and equator.

We have various facts that go to prove that this change does take place; for instance, we find the romains of plants and animals imbedded in coal beds and rock in the Frigid Zone, which are now known to inhabit none but the Torrid Zone. How came they there? Simply because the equator was once there. Professor Agassiz has also discovered the remains of immense glaciers in the Andes of South America, directly under the equator. How came they there? Only by once having had one of the poles at least nearer than at present. Now admitting that this theory of the changing of the poles is correct, let us see what the effect would be upon the globe. The earth is said to be about forty-five miles thicker through at the equator than it is at the poles; making twenty-two and one-half miles depression of the ball on each side of the equator; and as it is about six thousand miles from the equator to the poles, we have a down grade of about *nineteen feet to the mile.* If the earth's motion were stopped, the water from the equator would commence rushing to the poles and fill up that twenty-two miles and a half, or until all parts of the surface of the earth would be at an equal distance from the center. But as the earth revolves at the immense velocity of about one thousand miles an hour, it throws back the waters from the poles towards the equator sufficient to counteract the attraction of gravitation on the down grade to the poles, and keeps up a perfect equilibrium; and the waters remain comparatively of a uniform depth. If the solid earth were not of spheroid shape, but perfectly round, there would be all land at the poles, and all water at the equator.

The point that I wish to advance, hearing upon geology and the causes of earthquakes, is that as this change of the poles goes on, the surface of the earth must necessarily change with it, for if it did not, the earth would get out of balance, or in other words, would not run true, and would soon make a wreck of itself. But if the earth is a shell inclosing soft material, as most geologists concede it to be, then the crust would neceesarily yield and conform itself to that motion; and as the surface is composed of two substances, a fluid and a solid, of course the fluid, which predominates, is always ready to yield to it, as we see exemplified in our ocean currents, which are constantly flowing from one part of the world to another, to keep it in perfect balance. This, too, is probably the reason why we have so much more water upon the surface of the earth than land, for God never made anything for naught. If the land predominated, it would have an unsteady motion, and would evidently destroy itself. We have had an evidence of the changing of the ocean currents since the earthquake at St. Thomas, as it is said that the Gulf Stream has changed several degrees since that event, from its old course; and perhaps in a few thousand years, or after a few more such earthquakes, the stream may be destroyed entirely, or flow in some other direction to supply some deficiency created elsewhere.

I have endeavored to show the effect of this change of motion upon the fluid part of the earth; now let us see what effect it would have upon the solid portion. Of course that must yield and conform to it also, but as it is not free to move like the water, it will have a tendency to rise up bodily at the equator and sink down at the poles; but when it moves it goes in small sections at a time, and gives way with a sudden jar or quaking motion. If it is in a portion of the world that is rising, there will be two distinct shocks; one is the upward motion, the other is the vibration of the rocks caused by that motion. If it is in a portion of the earth that is sinking, there will be but one shock at a time, a sudden downward jar, for it tightens on the surface and prevents any vibration; and the latter consequently are less destructive. Upheavals loosen the surface, set it to vibrating, and are therefore more destructive in their effects.

Thus the earth gives way, first in one part, then in another, in one hemsiphere, and then in another, on the land, and under the ocean; and I venture to say that there is not a day passes in the year but there is an earthquake in some part of the world, perhaps not an hour. If it should give way in large sections at a time, they would be so destructive that it would render the world uninhabitable; but by a wise provision of nature the rocks are full of joints and seams, allowing the crust of the earth to move in comparatively small sections.

As I before romarked, we have twenty-two and one-half miles of difference between the extreme elevation of the equator, to the extreme depression of the poles, (deducting the difference between the freedom of the water, and the resistance of the rocks to move); therefore an abundant margin to go upon, in concluding that there is here cause enough to submerge the highest mountains or make dry land of the lowest depths of ocean. If the geologist will apply this principle to his science, he can readily account for all the geological changes which are constantly going on in the earth; for as one portion of the earth is lifted above the water, and as the vapors of the ocean rise and float over the land, the latter is condensed, falls in the shape of rain, and washes off the loose particles into the ocean, where each particle of a like specific gravity will be deposited in strata of like character, and by the immense pressure of the ocean they will be speedily converted into rocks, to be again submerged. And thus the work goes on from age to age.

The idea has been advanced that earthquakes are caused by electricity. Would it not be better to say that the appearance of electricity on such occasions is the *result*, and not the *cause* of the earthquake. Let us see which theory looks the most reasonable. We know that friction excites electricity; and if an earthquake takes place, there must be a powerful friction, in the joints or crevices of the rocks. We see the evidence of this immense friction of one mass of rock upon another, in working our quartz veins. There will always be, in a true fissure vein, on one side of it, a thin stratum of clay, or very finely pulverized rock, which I know of no way to account for but by the friction of the adjoining rock caused by the earthquakes. These same veins themselves are nothing more than immense cracks in the rock, caused by the earthquakes, and filled again by the circulation of the waters of the earth containing minerals. Like the blood of the human system, which is always ready to repair any injury done to it, so the waters of the earth—its blood—are ever ready to perform a like office.

William A. Begole.

Nevada, Feb. 18th, 1869.

Mechanical Progress in China.—Amongst the numerous evidences of the great changes that have begun in the Flowery Kingdom is the report, by the last steamer, that fresh artisans from Woolwich have been engaged at the Nanking arsenal, and that a small steamer, native owned, managed and engineered, is running from the Yangtze to Soochow, on the grand canal.

More Smelting.—Swansea is a new town in the White Pine district, about half a mile above Silver Springs. Smelting works are being erected there, and are promised to be in operation in a few days.

[Written for the Mining and Scientific Press.]

Explosives and their Uses.

New York Society of Practical Engineering held a regular meeting on Tuesday evening February 2d, at room 24, Cooper in the chair. The regular topic for the Institute, the President, James A. Whitney, evening was "Explosives and their Uses," and a paper on that subject was read by Dr. Dubois D. Parmelee. The paper first glanced at the history of gunpowder and inflammable compositions generally, referring their origin to a very early date in the history of the eastern nations. The formation of a large volume of gaseous material and its composition, and the effect of heat on the dilation of the gases produced was next discussed. The writer then passed to a consideration of the accidents due in many cases to the fact that precautions essential to safety in the manufacture of the explosive have been neglected. A method has been proposed for rendering gunpower less dangerous, consisting simply in diluting the powder with finely pulverized sand or glass. By this means the grains are separated from each other, and although the process does not prevent the burning of gunpowder when a spark reaches it, has yet the effect of retarding the combustion and preventing a violent explosion. The great objection, however, to this process, lies in the fact that the sand is liable to become separated from the gunpowder during transportation, and the former dangerous properties of the latter are renewed. The writer then gave a description of several compounds and preparations explosive in their character, among which we notice the following: The *pulvis fulminas* is composed of two parts of carbonate of potassa, one of sulphur, and three of nitre. When heated gently to fusion it explodes with a deafening noise. Augendre's white gunpowder, consisting of chlorate of potash, ferro-cyauide of potassium, and sugar; this was tried many years ago, and failed. An invention of Mr. Harsley and Dr. Ehrhardt, consists of a mixture of chlorate of potash with organic substances of a permanent character, such as tannic acid. This mixture is stated to be more powerful than gunpowder. An application of chlorate of potash has been proposed by M. Nochstaelter, a German chemical manufacturer. In the process for effecting this end, unsized paper is soaked in and coated with the chlorate, charcoal and sulphide of antimony, together with gum or some other substance of a binding character. The paper rolled up compactly burns with considerable violence. An explosive preparation which has been employed to some extent in blasting, consists of spent tan in small fragments saturated with chlorato of potash. Gun saw dust consisted of purified lignin converted into a substance of the nature of gun cotton, and then, when required for use, impregnated with saltpetre or a mixture of this with nitrate of baryta.

Gun cotton and its explosive properties were then considered. One pound of this material was stated to produce as much gas as three pounds of gunpowder. It is formed by exposing cotton prepared from finely carded and carefully purified cotton wool to the action of sulphuric and nitric acid of certain specific gravities. During the process of manufacture the cotton increases in weight about 78 per cent. One of the great difficulties in the way of using gun cotton as an explosive is its rapid combustion. One of the most successful expedients for modifying this is to dilute the gun cotton with raw cotton. Cartridges formed of this material burn more slowly than cartridges formed of pure gun cotton. A plan has also been put in practice for reducing the gun cotton to a pulp, as in the process of paper making.

The properties of nitro-glycerine as an explosive agent were next discussed. It is formed by the action of a mixture of strong nitric and sulphuric acids upon glycerine, the apparatus all the time being kept at a low temperature. The nitro-glycerine forms upon the bottom of the mixing vessels after standing for a few hours. It has a sweetish taste, no odor, and when placed upon the tongue produces headache. When left to itself it is exceedingly liable to spontaneous decomposition. Its destructive action has been estimated at about ten times that of gunpowder. Its frozen state is an exceedingly dangerous condition, for then a blow producing friction of the particles is apt to cause explosion. The writer closed his paper by describing the fuses employed for exploding charges of nitro-glycerine. The Bishop fuse, now in use in this country to a considerable extent, has two copper wires about five feet long insulated with gutta percha. The ends of these wires are fixed in a small wooden tube containing a priming powder. This tube is inserted in a copper cap containing the fulminate. The fuse is then connected with an electric machine by long wires and the charges exploded by the passage of the electric spark.

The reading of the paper was followed by some remarks on the subject of nitro-glycerine by Col. Chester, a gentleman who has had much to do with the material in blasting. He described the process by which the mixture is kept cool during the mingling of the ingredients. A glass tube passes down into the mixing vessel connected with a gasometer containing carbonic acid gas under pressure. The tube is furnished with radial arms bent at their extremities in a horizontal plane and perpendicular to the original direction of the arms. As the mixing of the ingredients warms the liquid, the escape of the carbonic acid gas through the arms, cools it. The principle here involved is that the gas escaping from pressure absorbs heat and renders it latent.

Dr. Bürstbinder, who has had considerable experience in company with Colonel Chester in the use of nitro-glycerine, then addressed the society. He remarked that the most important point in the employment of this liquid as regards safety, is the making of the material upon the spot. When this is carried out it is a much less dangerous article than gunpowder, while, if it be allowed to stand for a few months; it may decompose so much as to become exceedingly dangerous. It possesses an important advantage over gunpowder, in the fact that it requires no tamping.

The President spoke of the difficulty at first experienced in the introduction of gunpowder, as analagous to that experienced in the introduction of nitro-glycerine, and expressed a belief that the latter will soon be recognized as an important explosive agent. The meeting then adjourned to meet again in two weeks.

The Lone Pine Mint, says a correspondent of the *Sacramento Union*, is in active operation. The owner, superintendent and workmen, are combined in the person of Charles H. Aaron, who is also a correspondent of the Mining and Scientific Press. The coins are one-eighth of an inch, more or less, in thickness, with rounded edges and somewhat convex sides. Aaron buys silver which has been run through a furnace or base at Cerro Gordo, and refines it in a small furnance. Some gold, which is generally obtained from Coso, is melted with the silver. After the mass of seething metal has become sufficiently pure, it is poured into cold water, where it becomes finely granulated. From thence it is taken to a pair of delicate scales and carefully weighed and divided into small piles. Some of these bunches weigh 86-100 of an ounce, the remainder weighing 1 72-100 ounces, or nearly two ounces. Thus evenly divided, the metal is placed in separate crucibles and remelted. A very small iron pot is now brought forward, and a crucible taken out of the furnace, where its contents have been subjected to a high degree of heat, and the boiling metal is poured into the iron pot. After the liquid has become solid, the new coin is taken out and another coin is run. This operation is continued until all the crucibles are empty.

We have before us two pieces of silver which were formed in the above manner. One of them is a dollar and the other two dollars. The figures 86 on one side of the dollar show its weight, and on the other side are the initials "C. A.," immediately below which is stamped "$1." The two dollar piece, besides the mark indicating its value, is stamped "C. H. A.," and on the opposite side, "172."

Valuable Patents.—Mr. Bessemer derives an annual income of about $2,000,000 from his British steel patents, and the patentee of a device for dressing mill-stones by a revolving diamond, has realized over $1,000,000 the first year of his patent. The use of a diamond for this purpose is an American invention, and the estimated value of the exclusive right in England, for ten years, is $5,000,000.—*Hazeltine, Lake & Co's Circular.*

Mechanical.

THE HEATON PROCESS.—The English papors are still full of this subject. We have repeatedly referred to this method of steel making, and havo given the comments of *Engineering* and its correspondents. A recent number of that journal gives a summing-up of tho experiments which were made, and upon which Prof. Miller's favorable opinion was fonnded. We have not space for tho fignres, hut quote two paragraphs from the article,—the latter of which two is the concluding one: "It is unnecessary here to refer particularly to the chemical principles on which this method is based; the main question is as to the result, and a carefnl examinntion of the chemical data hitherto pnblished to elucidate that result is, alone, calculated to confirm and justify mneh of the adverse comment which Heaton's method has called forth." * * "Altogether, then, it is evident that the *rationale* of this method is involved in much obscurity, nnd that from n chemical point of view there is room for considerable doubt as to what is really the result obtained by its application to pig iron containing phosphorus and sulphnr. These circumstances alone certainly justify the demand for much fuller information than has yet been furnished, so that a fair opportnnity may be afforded of arriving at a correct estimate of the method."

PUMPING ENGINES.—In a comparison of the relative merits of the Cornish and the Fly-wheel pumping engines, by Robert Briggs, in the *Journal of the Franklin Institute*, for January, the writer shows that, in the first, the power is applied to the raising of a counterpoise from which is obtained the utmost possiblo effective impulse for the pnrpose of raising the column of water; while in the other, the tendency of the fly-wheel to a variable velocity, owing to variable impulses, being opposed to its effort to maintain a uniform one, there is a waste of power. The eonclnding sentence of the article is as follows.

"It is the losses of momentum and the frictional resistance of the water in the pumps, and passages, and pipes encountered in the transformation of a uniform circular motion into an irregnlar and reetilinear motion, that give the theoretic as well as practical superiority of the Cornish engine over any possible Fly-wheel one for pnmping."

BELTING.—Among the "belting facts and figures" compiled by the *Journal of the Franklin Institute*, we find the following: "A leather belt will safely and continuously resist a strain of 350 pounds per sqnare inch of section. The usual way of joining the ends of a belt—that is, by means of the leather thong—is the best after all, because it is the most convenient; the thong being an artiele more readily obtained and applied than any other of the numerous and ingenious means devised for securing the ends of a belt.

In the use of thongs, it is the practice of some engineers to eross them in lacing on both sides of a belt; with others to eross them on the outside only, laying the double strands evenly on each other in the line of motion and on the pulley side of the belt, which experieneo proves to be the better way."

STEAM-POWER TRANSMITTED.—The Portland and Kennebec Railway Company have run a 3-inch pipe from boiler-shop to machine-shop, a distance of four hundred and fifty feet, conveying steam-power for driving two engines of twenty-five and fifteen horse-power, carrying all the machinery of an extensive establishment. The pipe is four feet underground, is inclosed in three-quarter inch hair felting, and encased in a 7-inch box filled with calcine plaster. It has three slip joints to prevent breakage by expansion. When there is a pressure of 80 pounds of steam at the boiler, the same pressnre is maintained at the other end of the pipe. The new arrangement is found to work admirably, and will be a great saving in machinery, labor and fuel.—*Railway Times.*

SPECIFIC GRAVITY OF STEEL.—M. Carou has noted that the specifie gravity of steel diminishes with the number of times it is tempered.

SHARPENING OF FILES BY CORROSION.—Prof. Wurtz translates for the *Gas Light Journal*, from the *Chemisches Centralblatt*, the following directions for restoring worn-out files by means of neids: The files are first washed with a hot lye of soda, and all grease removed with brnshes. They are then snspended in a mixtnre of concentrated nitric acid with eight parts by measnre of water for twenty-five miuntes; then well cleaned in water with brnshes, and reimmersed for twenty-five minutes more in the acid mixture with addition of another eighth of strong acid. Brush again and reimmerse, after adding to the bath a 16th part of concentrated sulphuric acid. This heats the bath, and the etching proper now commences, and is kept up for three minutes, with a vibratory motion of the bath. Wash and brush and reimmerse in a bath similar to the last, with similar agitation for five minutes. Wash repeatedly with water, then with milk of lime, finally rinse again with water, dry quickly at a gentle heat and varnish while still warm with oil.

INFUSORIAL SILICA FOR CEMENT.—The following is from the *Mechanics' Magazine:* Böttger informs us that a cement of extraordinary binding power is made by using infusorial silica in place of quartz sand. This infusorial earth is found in Germany only, but it has been imported into this eountry in considerable quantities. It consists of hydrated silica, which combines with bases much more readily than silica in the anhydrous condition, as in quartz sand. The infusorial silica is mixed in about equal proportions with oxide of lead; about half a part of freshly slacked lime is then added, and the whole is then made into a paste with boiled linseed oil. The cement thus made quickly becomes as hard as sandstone, and will be fonnd extremely useful in such work as fixing iron in stone for balusters and railings. It is not likely to expand in setting, and thus no risk of splitting the stone will be incurred.

PRINTING IN COLORS.—The *Tribune* describes the new press, by which the simultaneous printing in several colors is accomplished. Its novelty consists in the adjustment of a series of secondary cylinders around the main printing cylinder. To each of these seeondary eylinders are attached fonntains, distributors, and rollers for distributing and rolling each color separately; and to this cylinder is also attached the electrotype whose impression is to be given to the paper in its passage over the main cylinder. The final impression, being black, is received by the form on the bed-plate, in the nsual manner; and the paper comes forth with its illustrations impressed in seven colors, as well as with the ordinary letter-press—all done at one revolution of the cylinder.

UTILIZING IRON TURNINGS.—A very simple and efficacious method of utilizing the abundant refuse of the machine shop, has just been patented by Mr. Edward Hammond Bentall. Iron cuttings, borings, or turnings are placed in cases of sheet iron, capable of containing about one hundred weight of the waste iron; the case, when filled, is submitted to the heat of a reverberatory furnace. When brought to a white heat, it is stamped with stampers, or put under severe pressure, which, owing to the highly heated and partially softened state of the metal, will convert it into a solid plastic mass or bloom.—*The Student.*

CEMENT FOR LEATHER.—The best is made by mixing ten parts of sulphide of carbon with one part of oil of turpentine, and then adding enough gutta percha to make a tough thickly-flowing liquid. One essential consists in freedom of the surfaces to be joined from grease. This may be accomplished by laying a cloth upon them and applying a hot iron for a time. The cement is applied to both pieces, and pressure applied until dry.

GRADES UPON RAILROADS.—It is found by calculation and experiment that heavy trains may descend a grade of 1-100th without attaining a greater speed than about forty or fifty miles per hour, even if allowed to run freely without applying the brake to check the speed. The velocity due to the accelerating force of gravity soon attains its greatest limit, and remains constant during the remainder of the descent, owing to the resistance of the air.

Scientific Miscellany.

Chemical Reactions Produced by Light.

Professor Tyndall recently read before the Royal Society, a remarkable paper, detailing some of his experiments with the vapors of volatile liquids. A glass tube was exhausted of air, and a given vapor then allowed to enter it together with air which had been purified. An electric lamp placed at one end of the tube, sent a beam of intense light lengthwise through this mixture of air and vapor. The effect upon the different vapors experimented upon, was various and remarkable. In some cases, the beautiful clouds which were formed, exhibited the appearance of leaves and flowers. Each vapor had its own specific cloud. "With vapor of nitrite of amyl, a shower of liquid spherules was precipitated on the beam. With a modification of the beam, the precipitation was so rapid and intense that the cone formed by the beam, before invisible, flashed suddenly forth like a luminous spear. With iodide of allyl, the vapor column revolved round the axis of the decomposing beam, drawn in at certain places like an hour-glass, while delicate cloud-filaments twisted themselves in spirals round the bells of the apparent hour-glass. With iodide of isopropyl the vapor formed globes and cylinders, which were animated by a common motion of rotation, disturbed at times by a paroxysm, in which beautiful and grotesque cloud-forms were developed, some representing a serpent's head, others buds which seemed to grow into flowers, and all of a gorgeous manve color. With hydrobromic acid the cloud resolved itself into a series of disks and funnels, then parasols and rings of a very pale blue color, and all rotating as in the former instance.

"With hydrochloric acid the cloud requires twenty minutes for its full development, but then it appears in sections, each possessing an exceedingly complex and ornate structure, exhibiting ribs, spears, tunnels, leaves, involved scrolls, and iridescent fleur-de-lis. With hydriodic acid another modification is seen, having a family likeness to the two immediately preceding, but with marked differences of development, for the green and crimson produced were the most vivid that Dr. Tyndall has yet observed. The development of the cloud, as he describes, was like that of an organism, from a more or less formless mass at the commencement, to a structure of marvelous complexity, at which he "looked in wonder for nearly two hours.'"

The different vapors are in these experiments differently decomposed. "Certain specific waves of the electric beam shake the molecules asunder."

Prof. T. anticipates "wide, if not entire, generality, for the fact that a liquid and its vapor absorb the same rays."

In this connection, we give this item: At a recent meeting of the Photographic Section of the American Institute, Professor Joy read the following extract from a private letter which he had received from Professor John Tyndall:

"My daylight hours have been recently occupied with the question of the chemical action of light upon vapors, and also with the blue color and polarization of the sky. These questions, which have been so long the great enigmas of meteorology, have, I hope, at length been brought within the grasp of experiment, and have been, to a great extent, satisfactorily solved. The condensed summary of my results is at the present moment in the hands of Sir John Herschell, who has manifested great interest in the inquiry. As soon as he sends it back to me I shall hasten its publication, and it will give me great pleasure to send you a copy of it."

PRUSSIC ACID IN THE LABORATORY.—M. Berthelot has just discovered that when a series of electric sparks is passed through a mixture of nitrogen gas and acetylene, or any hydrocarbon, in presence of a little potash and a certain quantity of hydrogen, prussic acid is slowly formed and absorbed by the potash.

PHOTOGRAPHING THE PYRAMIDS.—An expedition has started from Germany to visit Egypt, for the purpose of making a collection of photographic views of ancient inscriptions and monuments.

NATIONAL INSTITUTE OF SCIENCES, LETTERS AND ART.—On December 29th a meeting was held in New York, for the purpose of organizing a National Institute. A Constitution was after several preliminary meetings adopted, which was founded upon that of the French Institute, although of course modified according to circumstances. Several Academies will be organized under this Constitution.

The following circular was sent to the leading scholars of the country:

"The lack of any means of easy intercourse and free communication, and consequently of united effort and mutual support, has been felt for some time past by men of letters, artists, and scientific men in the United States. They constantly find themselves reminded of this lack by their weakness as a class, because although a class they are not a body with a recognized organization. Scattered over a wide expanse of country, they are, from this dispersion and this want, no less morally than physically isolated. There is no authority other than the temporary and shifting, although in some respects valuable one, of public opinion, by which their claims may be passed upon—no tribunal of their peers or of those of their own class to whose experience and judgment they would willingly defer—no representative council, the stamp of whose approval would be acknowledged by the public as well as by themselves. From the lack of such a center of union, of communication, and of combined action, they, and with them the cause of truth and knowledge, and the public welfare, suffer. In the hope, therefore, of compassing these objects, we propose to establish a National Institute of Letters, Art and Science, upon a plan outlined in a Constitution accompanying this Circular. We ask your coöperation."

The *American Naturalist* says:

"If, as it promises to do, the National Institute will bind together and thus efficiently guide and control the army of workers in letters, science and art, a new era has dawned for the development of knowledge and its practical results in America."

THE LAND OF THE NJAMNJAMS.—The French brothers Poncet, and Piaggia, an Italian traveler, have penetrated to longitude 24° E.—seven degrees west of the White Nile, and nearly to latitude 1° N. They have established the fact of the existence of another immense lake, lying on the equator, out of which flows a river, Babura, in a northwesterly direction, towards the Benui and Lake Tsad. Piaggia spent nearly two years among the Njamnjams, who are tailless, but cannibals. He was kindly treated by the chief, and was only prevented from reaching the new lake by civil wars. The account is one of the most important recent contributions to the geography of Central Africa. It is accompanied by a map of the region, by Dr. Petermann.

UREA FROM CARBONATE OF AMMONIA.—Basarow has discovered that *anhydrous carbonate of ammonium* is converted into *urea* by heating in a sealed tube to 130° C. (266° F.) The carbonate he obtained by the action of CO_2 on NH_3 dissolved in absolute alcohol. He has observed that the same result, conversion into urea, follows to a notable degree, upon the subjection of commercial carbonate of ammonia to a temperature of 130—140° C.; whence he infers that this latter may contain the anhydrous carbonate of ammonium. The following equation will make clear the theory on which Basarow based his investigation:

$$2(NH^4\,O,\,CO^2) = C^2\,H^4\,N^2\,O^2 + 4\,HO.$$

Gas Light Journal.

RENEWED POLAR EXPLORATIONS.—Dr. Hayes delivered a lecture in November last in New York, before the American Geographical Society, in which he proposed the renewal of explorations in the North Polar regions, and gave his reasons for believing that they could be successfully accomplished. He urges the "American route" by the way of Smith's Sound. This route is familiar to him, and he says he is as earnest as ever in his desire to lead a party over the course. The lecture has been printed in pamphlet form, and now the question is whether the men of wealth will aid the enterprise.

Communications.

In this Department we invito the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press.

Mechanico-Astronomical Cause of Geological Changes, and Earthquakes.

It would seem that the following simple circumstance in the physics of astronomy,—furnishing a mechanical explanation of geological changes not otherwise sufficiently accounted for, and at the same time a very possible constant cause of earthquakes,—could not have been overlooked by the cosmogonists, from Laplace down; yet we do not remember seeing or hearing the point of our correspondent heretofore advanced. The writer is known to our readers as having furnished us, not long since, with a method of obtaining perfect crystals of gold artificially:

Editors Press:—I propose to set forth a few ideas in relation to geological changes and earthquakes, which I have not yet heard advanced. We are living upon a sphere which revolves around the sun,—not in a perfect circle, but with an orbit of an elliptic form; and at the same time it is making 365 revolutions per annum, upon its own axis.

Now the question naturally arises, does one motion affect, or have any influence, upon the other? I cannot but think it does. Thus, as it passes from the flat side of the ellipse to the ends,—or in other words, from a long curve to a short one,—the two forces embodied in the earth must necessarily have a twisting effect—the orbit motion on the revolving motion,—consequently gradually changing the position of the poles and equator.

We have various facts that go to prove that this change does take place; for instance, we find the remains of plants and animals imbedded in coal beds and rock in the Frigid Zone, which are now known to inhabit none but the Torrid Zone. How came they there? Simply because the equator was once there. Professor Agassiz has also discovered the remains of immense glaciers in the Andes of South America, directly under the equator. How came they there? Only by once having had one of the poles at least nearer than at present. Now admitting that this theory of the changing of the poles is correct, let us see what the effect would be upon the globe. The earth is said to be about forty-five miles thicker through at the equator than it is at the poles; making twenty-two and one-half miles depression of the ball on each side of the equator; and as it is about six thousand miles from the equator to the poles, we have a down grade of about *nineteen feet to the mile.* If the earth's motion were stopped, the water from the equator would commence rushing to the poles and fill up that twenty-two miles and a half, or until all parts of the surface of the earth would be at an equal distance from the center. But as the earth revolves at the immense velocity of about one thousand miles an hour, it throws back the waters from the poles towards the equator sufficient to counteract the attraction of gravitation on the down grade to the poles, and keeps up a perfect equilibrium; and the waters remain comparatively of a uniform depth. If the solid earth were not of spheroid shape, but perfectly round, there would be all land at the poles, and all water at the equator.

The point that I wish to advance, hearing upon geology and the causes of earthquakes, is that as this change of the poles goes on, the surface of the earth must necessarily change with it, for if it did not, the earth would get out of balance, or in other words, would not run true, and would soon make a wreck of itself. But if the earth is a shell inclosing soft material, as most geologists concede it to be, then the crust would necessarily yield and conform itself to that motion; and as the surface is composed of two substances, a fluid and a solid, of course the fluid, which predominates, is always ready to yield to it, as we see exemplified in our ocean currents, which are constantly flowing from one part of the world to another, to keep it in perfect balance. This, too, is probably the reason why we have so much more water upon the surface of the earth than land, for God never made anything for naught. If the land predominated, it would have an unsteady motion, and would evidently destroy itself. We have had an evidence of the changing of the ocean currents since the earthquake at St. Thomas, as it is said that the Gulf Stream has changed several degrees since that event, from its old course; and perhaps in a few thousand years, or after a few more such earthquakes, the stream may be destroyed entirely, or flow in some other direction to supply some deficiency created elsewhere.

I have endeavored to show the effect of this change of motion upon the fluid part of the earth; now let us see what effect it would have upon the solid portion. Of course that must yield and conform to it also, but as it is not free to move like the water, it will have a tendency to rise up bodily at the equator and sink down at the poles; but when it moves it goes in small sections at a time, and gives way with a sudden jar or quaking motion. If it is in a portion of the world that is rising, there will be two distinct shocks; one is the upward motion, the other is the vibration of the rocks caused by that motion. If it is in a portion of the earth that is sinking, there will be but one shock at a time, a sudden downward jar, for it tightens on the surface and prevents any vibration; and the latter consequently are less destructive. Upheavals loosen the surface, set it to vibrating, and are therefore more destructive in their effects.

Thus the earth gives way, first in one part, then in another, in one hemisphere, and then in another, on the land, and under the ocean; and I venture to say that there is not a day passes in the year but there is an earthquake in some part of the world, perhaps not an hour. If it should give way in large sections at a time, they would be so destructive that it would render the world uninhabitable; but by a wise provision of nature the rocks are full of joints and seams, allowing the crust of the earth to move in comparatively small sections.

As I before remarked, we have twenty-two and one-half miles of difference between the extreme elevation of the equator, to the extreme depression of the poles, (deducting the difference between the freedom of the water, and the resistance of the rocks to move); therefore an abundant margin to go upon, in concluding that there is here cause enough to submerge the highest mountains or make dry land of the lowest depths of ocean. If the geologist will apply this principle to his science, he can readily account for all the geological changes which are constantly going on in the earth; for as one portion of the earth is lifted above the water, and as the vapors of the ocean rise and float over the land, the latter is condensed, falls in the shape of rain, and washes off the loose particles into the ocean, where each particle of a like specific gravity will be deposited in strata of like character, and by the immense pressure of the ocean they will be speedily converted into rocks, to be again submerged. And thus the work goes on from age to age.

The idea has been advanced that earthquakes are caused by electricity. Would it not be better to say that the appearance of electricity on such occasions is the *result*, and not the *cause* of the earthquake. Let us see which theory looks the most reasonable. We know that friction excites electricity; and if an earthquake takes place, there must be a powerful friction, in the joints or crevices of the rocks. We see the evidence of this immense friction of one mass of rock upon another, in working our quartz veins. There will always be, in a true fissure vein, on one side of it, a thin stratum of clay, or very finely pulverized rock, which I know of no way to account for but by the friction of the adjoining rock caused by the earthquakes. These same veins themselves are nothing more than immense cracks in the rock, caused by the earthquakes, and filled again by the circulation of the waters of the earth containing minerals. Like the blood of the human system, which is always ready to repair any injury done to it, so the waters of the earth—its blood—are ever ready to perform a like office.

William A. Begole.

Nevada, Feb. 18th, 1869.

Mechanical Progress in China.—Amongst the numerous evidences of the great changes that have begun in the Flowery Kingdom is the report, by the last steamer, that fresh artisans from Woolwich have been engaged at the Nanking arsenal, and that a small steamer, native owned, managed and engineered, is running from the Yangtze to Soochow, on the grand canal.

More Smelting.—Swansea is a new town in the White Pine district, about half a mile above Silver Springs. Smelting works are being erected there, and are promised to be in operation in a few days.

[Written for the Mining and Scientific Press.]

Explosives and their Uses.

New York Society of Practical Engineering held a regular meeting on Tuesday evening February 2d, at room 24, Cooper in the chair. The regular topic for the Institute, the President, James A. Whitney, evening was "Explosives and their Uses," and a paper on that subject was read by Dr. Dubois D. Parmelee. The paper first glanced at the history of gunpowder and inflammable compositions generally, referring their origin to a very early date in the history of the eastern nations. The formation of a large volume of gaseous material and its composition, and the effect of heat on the dilation of the gases produced was next discussed. The writer then passed to a consideration of the accidents due in many cases to the fact that precautions essential to safety in the manufacture of the explosive have been neglected. A method has been proposed for rendering gunpower less dangerous, consisting simply in diluting the powder with finely pulverized sand or glass. By this means the grains are separated from each other, and although the process does not prevent the burning of gunpowder when a spark reaches it, has yet the effect of retarding the combustion and preventing a violent explosion. The great objection, however, to this process, lies in the fact that the sand is liable to become separated from the gunpowder during transportation, and the former dangerous properties of the latter are renewed. The writer then gave a description of several compounds and preparations explosive in their character, among which we notice the following: The *pulvis fulminus* is composed of two parts of carbonate of potassa, one of sulphur, and three of nitre. When heated gently to fusion it explodes with a deafening noise. Augendre's white gunpowder, consisting of chlorate of potash, ferro-cyanide of potassium, and sugar; this was tried many years ago, and failed. An invention of Mr. Harsley and Dr. Ehrhardt, consists of a mixture of chlorate of potash with organic substances of a permanent character, such as tannic acid. This mixture is stated to be more powerful than gunpowder. An application of chlorate of potash has been proposed by M. Nochstaelter, a German chemical manufacturer. In the process for effecting this end, unsized paper is soaked in and coated with the chlorate, charcoal and sulphide of antimony, together with gum or some other substance of a binding character. The paper rolled up compactly burns with considerable violence. An explosive preparation which has been employed to some extent in blasting, consists of spent tan in small fragments saturated with chlorate of potash. Gun saw dust consisted of purified lignin converted into a substance of the nature of gun cotton, and then, when required for use, impregnated with saltpetre or a mixture of this with nitrate of baryta.

Gun cotton and its explosive properties were then considered. One pound of this material was stated to produce as much gas as three pounds of gunpowder. It is formed by exposing cotton prepared from finely carded and carefully purified cotton wool to the action of sulphuric and nitric acid of certain specific gravities. During the process of manufacture the cotton increases in weight about 78 per cent. One of the great difficulties in the way of using gun cotton as an explosive is its rapid combustion. One of the most successful expedients for modifying this is to dilute the gun cotton with raw cotton. Cartridges formed of this material burn more slowly than cartridges formed of pure gun cotton. A plan has also been put in practice for reducing the gun cotton to a pulp, as in the process of paper making.

The properties of nitro-glycerine as an explosive agent were next discussed. It is formed by the action of a mixture of strong nitric and sulphuric acids upon glycerine, the apparatus all the time being kept at a low temperature. The nitro-glycerine forms upon the bottom of the mixing vessels after standing for a few hours. It has a sweetish taste, no odor, and when placed upon the tongue produces headache. When left to itself it is exceedingly liable to spontaneous decomposition. Its destructive action has been estimated at about ten times that of gunpowder. Its frozen state is an exceedingly dangerous condition, for then a blow producing friction of the particles is apt to cause explosion. The writer closed his paper by describing the fuses employed for exploding charges of nitro-glycerine. The Bishop fuse, now in use in this country to a considerable extent, has two copper wires about five feet long insulated with gutta percha. The ends of these wires are fixed in a small wooden tube containing a priming powder. This tube is inserted in a copper cap containing the fulminate. The fuse is then connected with an electric machine by long wires and the charges exploded by the passage of the electric spark.

The reading of the paper was followed by some remarks on the subject of nitro-glycerine by Col. Chester, a gentleman who has had much to do with the material in blasting. He described the process by which the mixture is kept cool during the mingling of the ingredients. A glass tube passes down into the mixing vessel connected with a gasometer containing carbonic acid gas under pressure. The tube is furnished with radial arms bent at their extremities in a horizontal plane and perpendicular to the original direction of the arms. As the mixing of the ingredients warms the liquid, the escape of the carbonic acid gas through the arms, cools it. The principle here involved is that the gas escaping from pressure absorbs heat and renders it latent.

Dr. Bürsthinder, who has had considerable experience in company with Colonel Chester in the use of nitro-glycerine, then addressed the society. He remarked that the most important point in the employment of this liquid as regards safety, is the making of the material upon the spot. When this is carried out it is a much less dangerous article than gunpowder, while, if it be allowed to stand for a few months; it may decompose so much as to become exceedingly dangerous. It possesses an important advantage over gunpowder, in the fact that it requires no tamping.

The President spoke of the difficulty at first experienced in the introduction of gunpowder, as analagous to that experienced in the introduction of nitro-glycerine, and expressed a belief that the latter will soon be recognized as an important explosive agent. The meeting then adjourned to meet again in two weeks.

The Lone Pine Mint, says a correspondent of the *Sacramento Union*, is in active operation. The owner, superintendent and workmen, are combined in the person of Charles H. Aaron, who is also a correspondent of the Mining and Scientific Press. The coins are one-eighth of an inch, more or less, in thickness, with rounded edges and somewhat convex sides. Aaron buys silver which has been run through a furnace or base at Cerro Gordo, and refines it in a small furnance. Some gold, which is generally obtained from Coso, is melted with the silver. After the mass of seething metal has become sufficiently pure, it is poured into cold water, where it becomes finely granulated. From thence it is taken to a pair of delicate scales and carefully weighed and divided into small piles. Some of these bunches weigh 86-100 of an ounce, the remainder weighing 1 72-100 ounces, or nearly two ounces. Thus evenly divided, the metal is placed in separate crucibles and remelted. A very small iron pot is now brought forward, and a crucible taken out of the furnace, where its contents have been subjected to a high degree of heat, and the boiling metal is poured into the iron pot. After the liquid has become solid, the new coin is taken out and another coin is run. This operation is continued until all the crucibles are empty.

We have before us two pieces of silver which were formed in the above manner. One of them is a dollar and the other two dollars. The figures 86 on one side of the dollar show its weight, and on the other side are the initials "C. A.," immediately below which is stamped "$1." The two dollar piece, besides the mark indicating its value, is stamped "C. H. A.," and on the opposite side, "172."

Valuable Patents.—Mr. Bessemer derives an annual income of about $2,000,000 from his British steel patents, and the patentee of a device for dressing mill-stones by a revolving diamond, has realized over $1,000,000 the first year of his patent. The use of a diamond for this purpose is an American invention, and the estimated value of the exclusive right in England, for ten years, is $5,000,000.—*Hazeltine, Lake & Co's Circular.*

Mechanical.

THE HEATON PROCESS.—The English papers are still full of this subject. We have repeatedly referred to this method of steel making, and have given the comments of *Engineering* and its correspondents. A recent number of that journal gives a summing-up of the experiments which were made, and upon which Prof. Miller's favorable opinion was founded. We have not space for the figures, but quote two paragraphs from the article,—the latter of which two is the concluding one: "It is unnecessary here to refer particularly to the chemical principles on which this method is based; the main question is as to the result, and a careful examination of the chemical data hitherto published to elucidate that result is, alone, calculated to confirm and justify much of the adverse comment which Heaton's method has called forth." * * "Altogether, then, it is evident that the *rationale* of this method is involved in much obscurity, and that from a chemical point of view there is room for considerable doubt as to what is really the result obtained by its application to pig iron containing phosphorus and sulphur. These circumstances alone certainly justify the demand for much fuller information than has yet been furnished, so that a fair opportunity may be afforded of arriving at a correct estimate of the method."

PUMPING ENGINES.—In a comparison of the relative merits of the Cornish and the Fly-wheel pumping engines, by Robert Briggs, in the *Journal of the Franklin Institute*, for January, the writer shows that, in the first, the power is applied to the raising of a counterpoise from which is obtained the utmost possible effective impulse for the purpose of raising the column of water; while in the other, the tendency of the fly-wheel to a variable velocity, owing to variable impulses, being opposed to its effort to maintain a uniform one, there is a waste of power. The concluding sentence of the article is as follows.

"It is the losses of momentum and the frictional resistance of the water in the pumps, and passages, and pipes encountered in the transformation of a uniform circular motion into an irregular and rectilinear motion, that give the theoretic as well as practical superiority of the Cornish engine over any possible Fly-wheel one for pumping."

BELTING.—Among the "belting facts and figures" compiled by the *Journal of the Franklin Institute*, we find the following: "A leather belt will safely and continuously resist a strain of 350 pounds per square inch of section. The usual way of joining the ends of a belt—that is, by means of the leather thong—is the best after all, because it is the most convenient; the thong being an article more readily obtained and applied than any other of the numerous and ingenious means devised for securing the ends of a belt.

In the use of thongs, it is the practice of some engineers to cross them in lacing on both sides of a belt; with others to cross them on the outside only, laying the double strands evenly on each other in the line of motion and on the pulley side of the belt, which experience proves to be the better way."

STEAM-POWER TRANSMITTED.—The Portland and Kennebec Railway Company have run a 3-inch pipe from boiler-shop to machine-shop, a distance of four hundred and fifty feet, conveying steam-power for driving two engines of twenty-five and fifteen horse-power, carrying all the machinery of an extensive establishment. The pipe is four feet underground, is inclosed in three-quarter inch hair felting, and encased in a 7-inch box filled with calcine plaster. It has three slip joints to prevent breakage by expansion. When there is a pressure of 80 pounds of steam at the boiler, the same pressure is maintained at the other end of the pipe. The new arrangement is found to work admirably, and will be a great saving in machinery, labor and fuel.—*Railway Times.*

SPECIFIC GRAVITY OF STEEL.—M. Caron has noted that the specific gravity of steel diminishes with the number of times it is tempered.

SHARPENING OF FILES BY CORROSION.—Prof. Wurtz translates for the *Gas Light Journal*, from the *Chemisches Centralblatt*, the following directions for restoring worn-out files by means of acids: The files are first washed with a hot lye of soda, and all grease removed with brushes. They are then suspended in a mixture of concentrated nitric acid with eight parts by measure of water for twenty-five minutes; then well cleaned in water with brushes, and re-immersed for twenty-five minutes more in the acid mixture with addition of another eighth of strong acid. Brush again and re-immerse, after adding to the bath a 16th part of concentrated sulphuric acid. This heats the bath, and the etching proper now commences, and is kept up for three minutes, with a vibratory motion of the bath. Wash and brush and re-immerse in a bath similar to the last, with similar agitation for five minutes. Wash repeatedly with water, then with milk of lime, finally rinse again with water, dry quickly at a gentle heat and varnish while still warm with oil.

INFUSORIAL SILICA FOR CEMENT.—The following is from the *Mechanics' Magazine:* Böttger informs us that a cement of extraordinary binding power is made by using infusorial silica in place of quartz sand. This infusorial earth is found in Germany only, but it has been imported into this country in considerable quantities. It consists of hydrated silica, which combines with bases much more readily than silica in the anhydrous condition, as in quartz sand. The infusorial silica is mixed in about equal proportions with oxide of lead; about half a part of freshly slacked lime is then added, and the whole is then made into a paste with boiled linseed oil. The cement thus made quickly becomes as hard as sandstone, and will be found extremely useful in such work as fixing iron in stone for balusters and railings. It is not likely to expand in setting, and thus no risk of splitting the stone will be incurred.

PRINTING IN COLORS.—The *Tribune* describes the new press, by which the simultaneous printing in several colors is accomplished. Its novelty consists in the adjustment of a series of secondary cylinders around the main printing cylinder. To each of these secondary cylinders are attached fountains, distributors, and rollers for distributing and rolling each color separately; and to this cylinder is also attached the electrotype whose impression is to be given to the paper in its passage over the main cylinder. The final impression, being black, is received by the form on the bed-plate, in the usual manner; and the paper comes forth with its illustrations impressed in seven colors, as well as with the ordinary letter-press—all done at one revolution of the cylinder.

UTILIZING IRON TURNINGS.—A very simple and efficacious method of utilizing the abundant refuse of the machine shop, has just been patented by Mr. Edward Hammond Bentall. Iron cuttings, borings, or turnings are placed in cases of sheet iron, capable of containing about one hundred weight of the waste iron; the case, when filled, is submitted to the heat of a reverberatory furnace. When brought to a white heat, it is stamped with stampers, or put under severe pressure, which, owing to the highly heated and partially softened state of the metal, will convert it into a solid plastic mass or bloom.—*The Student.*

CEMENT FOR LEATHER.—The best is made by mixing ten parts of sulphide of carbon with one part of oil of turpentine, and then adding enough gutta percha to make a tough thickly-flowing liquid. One essential consists in freedom of the surfaces to be joined from grease. This may be accomplished by laying a cloth upon them and applying a hot iron for a time. The cement is applied to both pieces, and pressure applied until dry.

GRADES UPON RAILROADS.—It is found by calculation and experiment that heavy trains may descend a grade of 1-100th without attaining a greater speed than about forty or fifty miles per hour, even if allowed to run freely without applying the brake to check the speed. The velocity due to the accelerating force of gravity soon attains its greatest limit, and remains constant during the remainder of the descent, owing to the resistance of the air.

Scientific Miscellany.

Chemical Reactions Produced by Light.

Professor Tyndall recently read before the Royal Society, a remarkable paper, detailing some of his experiments with the vapors of volatile liquids. A glass tube was exhausted of air, and a given vapor then allowed to enter it together with air which had been purified. An electric lamp placed at one end of the tube, sent a beam of intense light lengthwise through this mixture of air and vapor. The effect upon the different vapors experimented upon, was various and remarkable. In some cases, the beautiful clouds which were formed, exhibited the appearance of leaves and flowers. Each vapor had its own specific cloud. "With vapor of nitrite of amyl, a shower of liquid spherules was precipitated on the beam. With a modification of the beam, the precipitation was so rapid and intense that the cone formed by the beam, before invisible, flashed suddenly forth like a luminous spear. With iodide of allyl, the vapor column revolved round the axis of the decomposing beam, drawn in at certain places like an hour-glass, while delicate cloud-filaments twisted themselves in spirals round the bells of the apparent hour-glass. With iodide of isopropyl the vapor formed globes and cylinders, which were animated by a common motion of rotation, disturbed at times by a paroxysm, in which beautiful and grotesque cloud-forms were developed, some representing a serpent's head, others buds which seemed to grow into flowers, and all of a gorgeous mauve color. With hydrobromic acid the cloud resolved itself into a series of disks and funnels, then parasols and rings of a very pale blue color, and all rotating as in the former instance.

"With hydrochloric acid the cloud requires twenty minutes for its full development, but then it appears in sections, each possessing an exceedingly complex and ornate structure, exhibiting ribs, spears, tunnels, leaves, involved scrolls, and iridescent fleur-de-lis. With hydriodic acid another modification is seen, having a family likeness to the two immediately preceding, but with marked differences of development, for the green and crimson produced were the most vivid that Dr. Tyndall has yet observed. The development of the cloud, as he describes, was like that of an organism, from a more or less formless mass at the commencement, to a structure of marvelous complexity, at which he "looked in wonder for nearly two hours.'"

The different vapors are in these experiments differently decomposed. "Certain specific waves of the electric beam shake the molecules asunder."

Prof. T. anticipates "wide, if not entire, generality, for the fact that a liquid and its vapor absorb the same rays."

In this connection, we give this item: At a recent meeting of the Photographic Section of the American Institute, Professor Joy read the following extract from a private letter which he had received from Professor John Tyndall:

"My daylight hours have been recently occupied with the question of the chemical action of light upon vapors, and also with the blue color and polarization of the sky. These questions, which have been so long the great enigmas of meteorology, have, I hope, at length been brought within the grasp of experiment, and have been, to a great extent, satisfactorily solved. The condensed summary of my results is at the present moment in the hands of Sir John Herschell, who has manifested great interest in the inquiry. As soon as he sends it back to me I shall hasten its publication, and it will give me great pleasure to send you a copy of it."

PRUSSIC ACID IN THE LABORATORY.—M. Berthelot has just discovered that when a series of electric sparks is passed through a mixture of nitrogen gas and acetylene, or any hydrocarbon, in presence of a little potash and a certain quantity of hydrogen, prussic acid is slowly formed and absorbed by the potash.

PHOTOGRAPHING THE PYRAMIDS.—An expedition has started from Germany to visit Egypt, for the purpose of making a collection of photographic views of ancient inscriptions and monuments.

NATIONAL INSTITUTE OF SCIENCES, LETTERS AND ART.—On December 29th a meeting was held in New York, for the purpose of organizing a National Institute. A Constitution was after several preliminary meetings adopted, which was founded upon that of the French Institute, although of course modified according to circumstances. Several Academies will be organized under this Constitution.

The following circular was sent to the leading scholars of the country:

"The lack of any means of easy intercourse and free communication, and consequently of united effort and mutual support, has been felt for some time past by men of letters, artists, and scientific men in the United States. They constantly find themselves reminded of this lack by their weakness as a class, because although a class they are not a body with a recognized organization. Scattered over a wide expanse of country, they are, from this dispersion and this want, no less morally than physically isolated. There is no authority other than the temporary and shifting, although in some respects valuable one, of public opinion, by which their claims may be passed upon—no tribunal of their peers or of those of their own class to whose experience and judgment they would willingly defer—no representative council, the stamp of whose approval would be acknowledged by the public as well as by themselves. From the lack of such a center of union, of communication, and of combined action, they, and with them the cause of truth and knowledge, and the public welfare, suffer. In the hope, therefore, of compassing these objects, we propose to establish a National Institute of Letters, Art and Science, upon a plan outlined in a Constitution accompanying this Circular. We ask your coöperation."

The *American Naturalist* says:

"If, as it promises to do, the National Institute will bind together and thus efficiently guide and control the army of workers in letters, science and art, a new era has dawned for the development of knowledge and its practical results in America."

THE LAND OF THE NJAMNJAMS.—The French brothers Poncet, and Piaggia, an Italian traveler, have penetrated to longitude 24° E.—seven degrees west of the White Nile, and nearly to latitude 1° N. They have established the fact of the existence of another immense lake, lying on the equator, out of which flows a river, Babura, in a northwesterly direction, towards the Benui and Lake Tsad. Piaggia spent nearly two years among the Njamnjams, who are tailless, but cannibals. He was kindly treated by the chief, and was only prevented from reaching the new lake by civil wars. The account is one of the most important recent contributions to the geography of Central Africa. It is accompanied by a map of the region, by Dr. Petermann.

UREA FROM CARBONATE OF AMMONIA.—Basarow has discovered that *anhydrous carbonate of ammonium* is converted into *urea* by heating in a sealed tube to 130° C. (266° F.) The carbonate he obtained by the action of CO_2 on NH_3 dissolved in absolute alcohol. He has observed that the same result, conversion into urea, follows to a notable degree, upon the subjection of commercial carbonate of ammonia to a temperature of 130—140° C.; whence he infers that this latter may contain the anhydrous carbonate of ammonium. The following equation will make clear the theory on which Basarow based his investigation:

$$2(NH^4O, CO^2) = C^2H^4N^2O^2 + 4HO.$$

Gas Light Journal.

RENEWED POLAR EXPLORATIONS.—Dr. Hayes delivered a lecture in November last in New York, before the American Geographical Society, in which he proposed the renewal of explorations in the North Polar regions, and gave his reasons for believing that they could be successfully accomplished. He urges the "American route" by the way of Smith's Sound. This route is familiar to him, and he says he is as earnest as ever in his desire to lead a party over the course. The lecture has been printed in pamphlet form, and now the question is whether the men of wealth will aid the enterprise.

California Academy of Sciences.

A regular meeting of the Academy took place on Monday evening, March 1st, the President, Dr. Blake, in the chair, and fifteen members present. Dr. George Hewston, A. Earenstein, James F. Breed and Mr. Easton, were elected members.

METEOROLOGY.

The subject of Meteorology was introduced hy the President as regularly before the Society, for consideration. Dr. Henry Gibbons stated that no part of the world occupied an analagous position to California, as we had three climates—one in Southern California, near Mexico, one in the northern portion of the State adjacent to Oregon, and one in San Francisco. It was seldom that so long a mountain range was found parallel to the meridian line. The telegraph he thought could he made useful in San Francisco as an indicator of storms. He spoke of an occasion when he was at the Smithsonian Institute at Washington, where daily or hourly reports of the weather are received from all parts of the Atlantic States. On that occasion he sat down with Prof. Henry before a large relief globe, and located the storms as they were reported. In this way they traced a storm as it was approaching, hundreds of miles away, until it finally burst upon the city. He said that had he heen placed five hundred miles above the earth, and could have looked down upon the atmosphere, he could not have obtained a better view of it than he did on that occasion. The phenomenon of storms was a most interesting one, particularly here, where the prosperity of the whole State depended on rains. An almost certain prognostic of rain was the occasion of three hot days in succession. We had just experienced three hot days, and the rain he expected would soon he here. Three hot daye alwaye followed a Norther, and rain followed the three hot daye.

Professor Davidson and Dr. Ayers were named as suitable men to act on the proprosed Meteorological Committee, the latter having given much attention to the subject it was stated. Colonel Williamson was named as a suitable member, and also Mr. Mumford. The matter of appointiug a committee was postponed to the next meeting.

THE SAN JOSE MEAT SHOWER.

Specimens of some meat that fell from the sky at San José recently, were presented by Dr. Kellogg. He gave an account of the fall of meat over twenty acres of ground, as learned from an ohserver, Mr. Houck, aud said he was informed that nerves, muscle and hone were found, some imhedded in the soil, helonging either to small animals or fish. This meat was alleged to have fallen about three o'clock P. M., when the sky was clear, and to have struck persons upon the shoulder. Reports were read from persons at San José, in which it was stated that flesh, brains, blood and bones covered an area of twenty acres. The samplee of the flesh introduced had a fishy smell.

A member argued that during the recent flood multitudes of gophers and squirrels were drowned, and it was likely that this fleeh was the remains of those small animals after they had beeu picked by hawks.

Another memher thought that they might have been carried up by a whirlwind, which might have lifted even larger animals, such as cattle; or that if it was the remains of fish, it might have been carried up from the eea by a waterspout. The President stated that there had, no douht, been showers of frogs ere now.

Mr. A. F. Beardsly said such a shower occurred in Tenuessee eome yeare since.

Dr. Henry Gihhons eaid the lightness of the bones would not let them be imbedded in the earth by their weight, bnt an overflow might do so. The disgorging of flesh and bones by birds was not uncommon. They throw up and let fall such things from time to time, and in over-dry atmosphere these fragments would not corrupt.

Dr. J. G. Cooper eaid only the indigestible parts would be disgorged, while the digestible parts were what was found. These pieces might have been washed from some slaughter house.

Mr. Beardsly said rats were often found with their skins turned wrong side out, and all the flesh gone; so also were rabbits, squirrels, and gophers.

Mr. H. G. Bloomer asked what effect waterspouts had on animals taken up in them.

President Blake thought a whirlwind could not tear things to pieces as these things had heen torn.

Dr. Kellogg eaid he had seen it done on the hardest substancee, trees, rocks, etc.

Mr. Beardsly said such a case occurred at Gold Hill, in 1862, when a whirlwind took up 4,000 feet of lumber and tore it all in shreds.

Mr. H. G. Bloomer asked if a microscopic examination had heen made of the hones sent here from San José.

Dr. James Blake said they had heen examinecl, hut not with sufficient care to determine the kind of animal they helonged to.

MAGNETIC STORM.

A communication was read, from W. F. Stewart, stating that a magnetic storm occurred at a place near San José, in which the needle suddenly varied greatly. Mr. Herman was making a survey, and saw the needle whirl suddenly around. Dr. Blake said he had seen the needle dip in San Ramon Valley, Contra Costa county, far more than on this side of the mountains.

DONATIONS AND SPECIMENS.

A numher of hooks on Microscopy, etc., were donated by Mr. Stretch.

A specimen resemhling coke, strikingly like authracite, heing a residuum of petroleum from Downersville Foundry, at Corey, Peunsylvania, was presented to the Society by A. F. Beardsly.

A specimen of the *Dendrocygna arborea*, or long-legged duck, recently arrived from Mexico, and found in our market, was exhibited by Dr. Cooper.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING FEBRUARY 2d.

86,348. — IMPROVEMENT IN CARRIAGE SPRINGS.—John Balbach, San José, Cal.:

I claim the adjustahle thorough-hrace F, right and left haud screw-holt L, spring B, and fixed standard A, combined and arranged substantially as described for the purpose set forth.

This inventiou relates to an improvement in carriage springs, and it consists in a eingle leaf without any holes in it, so attached to the reaches, and supported by standards or braces, that in combination with the straps which support the carriage body it forms a perfectly easy spring and without any strain on the reaches.

86,371.—IMPROVEMENT IN CHURNS.—G. A. Dabney, San José, Cal.:

I claim the comhination of the dasherhandle F, lower dasher G H, adjustable upper dasher I J, tuhe K, and detachahle guide-frame B D, with each other, suhstantially as herein shown and described, and for the purpose set forth.

86,375.—IMPROVEMENT IN HARVESTERS.—Sharron P. Doane, San Francisco, California, assignor to Self and Leonard Treadwell, of same place:

1. I claim the levers I I, shaft K, arm N, and rods M and O, combined and arranged substantially as described for the purpose specified.

2. In combination with the levers I I, supporting a harvester reel, the arrangemeut of the pulleys U and V, on au axis forming the fulcrum of one of said levers, substantially in the manner and for the purposes described.

This improvement consists in so connecting the reel which brings the standing grain to the knives, that it is instantly adjustable and can be raised or lowered hy the driver when necessary. This is accomplished by attaching the reel to the frame of the machine by levers at either end, and more especially so that the belts are not effected by raisiug or lowering the reel. These levers are connected by another series with a hand lever by which the whole are operated, and which is within easy reach of the driver.

86,379.—IMPROVED APPARATUS FOR SAVING GOLD AMALGAM AND QUICKSILVER.—George R. Evans, Virginia City, Nevada, assignor to Self and John White, of same place:

I claim the curved plate A, slotted at *a a*, together with the box C, having the partitions D D, with the slots E E and F, the whole constructed and operating substantially as herein described.

This is a corrugated riffle, of amalgamated irou or copper, which has recently attracted considerable attention in Gold Hill, Nevada, where it has beeu introduced. It is described in our issue of Oct. 17, 1868.

86,388.—IMPROVED APPARATUS FOR SAVING FLOATING GOLD.—David Gay, Jr., Vallejo, Cal.:

1. I claim surrounding a hollow cylinder of light material A, either inside or outside, or both, indented and amalgamated metal plates *a* and *b*, or equivalent device for gathering the gold from auriferous sands on the heach, suhstantially as described.

2. I claim the spindle C, rotating in the metal plates D D, and the supporting arms *c c c*, in combination with the hollow cylinder C, or equivalent device, suhstantially as described.

3. I claim the cahle E, when attached to the hollow cylinder A, together with the anchor F, for regulating the movements of the cylinder, substantially as described for the purpose set forth.

4. I claim washing the auriferous sands on the sea shore hy means of amalgamated surfaces, either cylindrical or otherwise, when the same is operated by the surf or waves of the sea, suhstantially as and for the purposes described.

An apparatus for heach gold washing, consisting of a series of rolling logs or cylinders, anchored in the surf. The claims explain the device.

86,392.—BEARING FOR SHAFTS.—Jerome Haas, Stockton, Cal.:

1. claim the combination of the cam groove E, roller H, lever F, and pump D, for forcing a lubricator beneath the shaft, substantially as described.

2. In comhination with the ahove claimed device the discharge cock J, operated hy the crank or arm O, adjustahle rod N, lever K, and groove M, suhstantially as and for the purposes set forth.

This invention relates to an improved device known as an anti-friction etep or bearing for shafts, it heing applicable to propeller shafts and all such as have a horizontal throat, but more especially as a step for vertical ehafts, and it consists in the introduction of water beneath the end of the shaft, hy a pressure sufficient to slightly elevate it. This is accomplished by means of a small force pump, operated by the revolution of the shaft, while, by means of a discharge cock on the opposite side—also operated by the shaft—the elevation to which it rises is always regulated and controlled.

86,601.—IMPROVEMENT IN GATE LATCHES. John W. Still, San Francisco, Cal.:

I claim the spring B, hook C, handle D, and plate or catch G, combined and arranged to form a gate or door fastening, euhstantially as herein described.

This gate latch can be easily operated from either side of the gate. It cannot be opened by cattle. The latch is in the form of a hook, having a suitable place arranged, in which the fingers may be placed to draw back the hook in order to unlatch the gate. The hook is attached to the gate so as to leave a connecting epring between it and the attachment, aud an inclined slot is cut in the gate beneath the spring, to allow the hook to be drawn back. The inventor is now engaged in manufacturing his improved latch, which can be made and sold cheap.

86,475. — IMPROVED BOOT AND SHOE STRETCHER—Perry Veitch, San Francisco, Cal.:

I claim the comhination in a boot and shoe etretchiug last of the adjustable sections A and B, provided with the plates *a* aud F, and screw D, with the hinged adjustable instep H, and adjusting screw J, substantially as described and for the purposes specified.

This is a very simply but evidently effective device for etretching the toes of boots; consisting of a last with a split toe, operated by a screw.

86,474. —IMPROVEMENT IN GUIDES FOR SEWING MACHINES.—W. H. Vau Vlear, Stockton, California, assignor to Self and William E. Greeu, of same place:

I claim the guide *a*, provided with the toe *a'* and the spring flauge *b b*, as and for the purpose specified.

86,489. — IMPROVEMENT IN LUBRICATING JOURNAL BOXES.—Ephraim A. Atwood, and Harry H. Bodwell, of San Francisco, Cal.:

We claim the box A B, having a reservoir C, hung below the shaft F, said box heing provided with the circumferential grooves x x, passages G G, and *y y*, and with an elastic surfaced-wheel D, all as herein shown and described.

The wheel above meutioned carries the oil upwards, therehy repeating its use. The dévice is used by the inventors in the construction of their windmills. After well testing they consider it a very effective lubricator.

86,608.—IMPROVEMENT IN GANG PLOWS.—J. Tustin, Portland, Oregon:

I claim the levers A B C D E, the links G and F, (in which may he rotated the hent axle R) the bent axle R, aud the latch I, when used in the manner described and for the purposes set forth.

86,564.—IMPROVEMENT IN ELEVATOR AND TABLE FOR FEEDING GRAIN SEPARATORS. Don Carlos Matteson and Truman Pane Williamson, Stockton, Cal.:

1. We claim the cross har D, and the boxes or eyeholts E E, suhstantially as and for the purpose specified.

2. We claim the hinged-drop bar K, and the holding-hraces N N, constructed and operated substantially as and for the purposes herein described.

86,565. — IMPROVEMENT IN HORSE HAY FORKS.—Don Carlos Matteson and Truman Pane Williamson, Stockton, Cal.:

1. We claim the plate O, with its lugs M M and *u*, and the spur P, constructed and arranged suhstantially as herein described.

2. The stirrup A passing around the post N, suhstantially as and for the purpose described.

The last patentees named have made quite a number of improvements in agricultural impliments during the past few years. Their inventions are worthy of a full notice, which we shall be able to give next week.

New Inventions.

GAS FROM BITUMINOUS SHALE.—Jacob E. Bowman, of Sacramento, has entered a caveat for a new method of manufacturing gas from the hituminous shales found along the railroad in the foothills, and taken hy many to be coal, but which will not burn. The cost of the apparatus for the largest house will not exceed $80.

NEW SHINGLE MACHINE—A machine for shaving sawed shiugles has heen invented hy H. C. Babcock, of Humholdt county. The thick end of two wedges iu the ehape aud of the length of a shingle are each placed hetween the edge of two knives, one over the other, and with their edges toward the thin edge of the wedges. The guards, wedges and shingles are stationary. The butt end of the shingle is placed between the edges of the knives, and the knives are drawn to the thin ends of the wedges. In front and behind the knives are two sliding platforms, each with a gutta percha roller next to the knives; the oue to force the shingle betweeu the knives, and the other to remove it when shaved. The knives and platforms are connected hy iron rods. A fixed frame is placed over the eliding platform in front of the knives to hold the shingles. A knife and spring are attached to the end of the platform furthest from the shaving knives to edge and feed. The platforms and knives move horizontally.

FOARD'S VACUUM VENTILATOR.—Mr. J. W. Foard, Deputy-Collector of S. F. has taken out a patent, says the *Times*, the object of which is to ventilate ships by means of horizontal draught pipes near the deck, through which the winds circulate, the same heing connected hy vertical euction pipes with euch parts of the hold as are to be kept nnder perfect ventilation. The air rushing from the hold through the perpendicular pipe is the same in amount and velocity as that which is impelled through the horizontal pipe by the movement of the vessel. The ventilator being an exhausting apparatus, Mr. Foard places it as far aft on the ship as practicable, and provides an opening as near the how as may be, to let in air; when, with every other part hermetically sealed, there must be a current under the ship'e decks, from bow to stern, in exact ratio to the size of the ventilator, meanwhile effectively preventing the admission of rain into the ship through the pipes, The invention is responsive to one of the most important problems that has come up, in connection with commercial navigation, how effectually to ventilate ships so that damage to cargoes so common from sweating, may he prevented. It is said to accomplish the purpose in ships, and is to be adapted to theatres, hotels, churches, mines, and railroad cars.

NOURISHMENT IN BEER.—Professor Liehig says that fourteen hundred and sixty quarts of the best heer, contains exactly the amount of nourishment which is contained in one loaf of bread weighing 2½ pounds. So that if a man is in need of that amount of nourishment, and has pleuty of time to spare, he can, if he likes, take the heer. We prefer the *shortest* way.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, March 6, 1869.

City Stocks.

Since our last similar reference the transactions in city shares and bonds have been comparatively small, and mostly from private hands. In the Board sales of San Francisco Gas were effected at $77@78. The usual monthly dividends of our local institutions have been made as announced on the third page of this circular. The North Beach and Mission Railroad resumed the monthly disbursement of dividends the present month, the last one having been made in October, 1868. We also call attention to our corrected statement of assets of the various local insurance companies of this city, as rendered to the Insurance Commissioner at the close of 1868.

Mining Share Market.

The mining share market for the period under review has been characterized by the usual activity, and embraced a number of stocks that have been quiet for some time past. Some of the lately incorporated claims also made their appearance, selling to a considerable extent. At the close, the market is quite firm for several leading descriptions.

The amount of bullion shipped through Wells, Fargo & Co's Express from Gold Hill, Nevada, during the month of Febrnary, amounted to $229,251.

The following resolution concerning the placing of stocks on the regular list, came up on the 25th of February, in regular order, and, on motion, was amended and adopted, and reads as follows: That all applications to have stocks placed upon the regular list of this Board, shall first be referred to the proper committee, and if by such committee they shall be reported favorably upon, then, after paying into the treasury of this Board the sum of three hundred dollars, they may be placed on such list for the term of one year; and on the payment of one hundred dollars yearly thereafter, they shall be retained on said list.

We notice, according to the returns made by the Assessors of the State of Nevada, that the bullion yield for the entire State amounted to $16,172,500 during the year 1867, and $13,-317,000 for 1868, giving a yield of about $2,-500,000 over and above the product of the Comstock lode in 1867, and $4,800,000 in 1868.

The past condition of White Pine, Nevada, affords no possible criterion of its future. It has already achieved so great a celebrity as to have become an object of deepest interest in all portions of the Union, and the results obtained since the discovery of its rich lodes have been so wonderful as to cast all former precedents into the shade. Whether White Pine will prove to be as permanent as the Comstock Lode, is of course mere matter of conjecture at present, and each person will form some theory for himself. A large number of mining companies, representing over one hundred millions of dollars, have already been organized to work the mines of that region; but this fact does not seem to at all deter others from pursuing a like course, and the number increases with such rapidity as to defy exact mention. The bullion product of Lander county is given in the official biennial report of W. K. Parkinson, Controller of Nevada, as follows: In 1867, Lauder county yielded $1,357,816 in bullion, and in 1868, $2,463,980, showing an increased production of $1,106,164, due entirely to the recent discoveries at White Pine. The heavy disbursement of capital, and the thousands of miners who will be employed by it to vigorously unfold the mineral resources of that region, together with the astounding richness of its ores as developed so far, can scarcely fail to render White Pine a place of remarkable bullion production.

ALPHA—declined from $54 to $47 50, then sold at $50, and closed at $52. On the 3d inst. the northcast drift was reported to be getting into a fine white quartz, almost powdered, containing sulphurets. Will soon connect with Imperial ground, when better air will be obtained for the workmen....BELCHER ruled at $30@24, improved to $27 50, and closed at 27. This company has accumulated about 350 tons at the old dump, and 100 tons at Segregated Belcher dump. They are drifting south on 335 level in hopes of finding a new body....CHOLLAR-POTOSI sold at $166@176, aud closed at $173. For the week ending Feb. 26th, 700 tons of ore were extracted. Nothing of special interest concerning the mine....CONFIDENCE improved to $41, closing at $41.

CROWN POINT—has been more active than usual, improving from $73 75 to $80, and closing at $76. For February account, so far, $21,535 in bullion has been received. Most of the ore is taken from the 600 level. The east drift on 1100 level is in 108 feet, and the rock, although still quite hard, is said to be easier to work than heretofore. The northeast drift on 900 level is in east of east clay wall over 100 feet, the face being in granite.....GOLDEN CHARIOT (Idaho) advanced from $48 to $57, and at close $55 is bid. The receipts of bullion during the months of December and January amounted to $101,656 from 589 tons of ore. During the same time they disbursed $50,000 in dividends.

HALE & NORCROSS—gained great activity to ward the close of the week, advancing from $77 to $97, and closing at $95. A telegram states that the tunnel on the fifth level is in ten feet of ore, and the street report is that the ore is thirteen feet wide. Assays show it to be a good milling quality.

EMPIRE MILL—was in the market at $75@76. The bullion returns for the month of February foot up $15,736 84 against $13,655 in January. ....GOLD HILL QUARTZ sold at $50. For the month of February the bullion receipts aggregate $5,169....EUREKA (Cal.) shows a bullion yield of $53,000 during the month just closed.

KENTUCK—is in fair request, rising from $238 to $285, receding to $255, and closing at $263. The receipts on February account have been increased to $50,676....OPHIR declined from $41 to $37, and closed at $38. On the 3d inst. the lower drift had been carried a distance of 57 feet. No change in the rock.

IMPERIAL—sold within a range of $99@104, and closed at $109. During the month of February the bullion returns amounted to $38,070 against $46,728 in January, and $44,288 in December. It is believed that from 10,000 to 12,-000 tons of ore still remain in the Alta mine, which will mill from $12 to $14 per ton, the principal portion of which is found on the 230, 400 and 517 levels, the 90 and 150 levels being about exhausted. The mill can be kept running four months longer on ore from the Alta mine, during which time it is expected they will be able to thoroughly prospect the two levels now being opened from the Imperial-Empire shaft, and these localities do not show any favorable indications at present....SIERRA NEVADA sold during the week at $27 50@29. The bullion returns for February foot up $3,728. In January the bullion yield amounted to $9,998, and in December, $7,568. At present the mine exhibits an improved appearance, and the future prospects are apparently much brighter.

SAVAGE—did not sell to so large an extent as the previous week, commanding prices varying from $66 50 to $71 50, and at the close realizing $70....YELLOW JACKET declined from $75 to $70 75, and closed at $71....SILVER COBN (Idaho) sold to a large extent during the week, advancing from $10 50 to $19. The mine consists of 600 feet, divided into twenty shares to the foot. The office is located at 418 California street; W. J. Williams, Secretary....For AMANOR $295 is asked. The bullion yield for February will reach $64,000.

OCCIDENTAL—sold at $32@34 50, and closed at $35. The *Enterprise* of the 2d instant, says: Yesterday morning the lower tunnel of the Occidental tapped a vein of about fifteen inches of water. The tunnel is being run on the west side of the lead and the water comes in at the bottom and from the east side of the tunnel. The striking of the water is considered a very favorable indication. The water will be of great value to the company, as they intend building a large mill at the mouth of their tunnel. The water found comes up through the solid rock. It is well known that there is a large body of water east of the ledge which can be reached whenever it is needed, by running a drift through the east clay wall. The point where the present stream of water has been cut is about 850 feet from the mouth of the tunnel. This company will declare a dividend on Friday next of $2 per share. This is their first dividend, and although not large, is still very good when we consider the great amount of work which is being done for the development of the mine. They expect hereafter to declare a dividend regularly every month.

THE NEW "CITY GAS COMPANY," of which Hayward, Bell, Friedlander, Tevis, etc., are trustees, have purchased land on the Presidio, now occupied by North's shipyard, near the rolling mills. If they obtain a franchise from the Board of Supervisors they will immediately commence the construction of their works, intending to have them in full operation, with pipes laid, and all the necessary accessories, to supply the city with gas within from eighteen months to two years.

AN OLD PROSPECTOR.—Wm. Sublett, inventor of several improvements in paddle wheels and steel saws, recently left this city to pitch his tent in White Pine.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

THE ELKO BITUMINOUS SHALE is found two miles from the railroad in a stratum eight feet thick, and has been located over six square miles. The Virginia *Enterprise* says: "Scientific men who have examined the deposit pronounce it bitnminons shale, covering cannel coal, but say that it is superior in every respect to anything of the kind ever found in America. From tests made it is said to have shown 42¼ per cent. coal oil, and it is said that one ton of the shale will make 800 feet of gas, of a superior quality." The authority is no doubt good, but we would like to see some of this cannel coal; and it strikes us as possible that an error of thirty or forty per cent. may have been made in determining the coal oil.

PHYSICAL LAW AND POSTAGE STAMPS.—Postage stamps that are wet on *both* sides are not liable to peel off. If wet only on one side, the expansion is uneven, and the adhesion must be very perfect to prevent peeling.

THE GREAT MODERN SPECIFIC.—"Nothing new under the sun," said Solomon: "History repeats itself," says a modern essayist. Every day some sententions fellow or another insists that the Present is indebted for every so-called "new idea" to the Past. Some folks go so far as to believe that there is an allusion to the iron horse of the railroad in the old testament. But where among the mists of antiquity is the prototype of the PLANTATION BITTERS to be discovered, that stimulant without a sting, that tonic without one injurious or even questionable element to interfere with its perfect work of physical regeneration? In a general way the sages of long ago recommended vegetable remedies for the "healing of the nations," but it was not until this incomparable Vegetable Elixir was introduced, that the desired object was attained. It is the best combination of tonic and alterative botanic materials that the world has ever seen.

* * *

IT may be singular, perhaps not, that no one purchasing spectacles of C. Muller, 205 Montgomery street, is ever dissatisfied with his bargain.

* * *

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on its subscription books. *Nevada Gazette.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Chronicle, Feb. 20th: The Pennsylvania Co. is making gratifying progress toward the ledge. The tunnel is now in about 905 feet. The rock is seamy, and it is evident that the ledge is not far off.

In sinking the Morning Star shaft Superintendent Gamble has struck a body of the rich black ore which has made this claim so valuable. The shaft having been completed, Mr. Gamble, by running a short drift, will soon strike the heavy body of ore in the lower level. The experimental working of the ore by the chlorination process at the Markleeville Mill has proved a perfect success in every way, and the ore can now be worked without the use of salt, which will be a saving of $10 on every ton of rock worked. The Co. will soon commence the erection of new furnaces at Markleeville, and expect to have the mill running again as a permanent institution in about six weeks.

The *Herald*, of this city, says: From private correspondence we learn that splendid headway is being made in the Imperial mine, and the prospects are fair to cut the Triumph ledge by the 1st of May. They made 14 feet last week with but two shifts of men. The Mount Bullion, on the opposite side of the river and a little lower down than the Imperial, is also making better headway than for a long time, having made 16 feet in the last week. This Co. will soon cut their finest ledge, which gives good promise of yielding rich ore in abundance. The Morning Star, in Mogul, have got their main shaft down to a point even with the lower level, and are now running a tunnel to intersect the drift from the incline. They have cut several small bodies of good ore in sinking the main shaft, and as soon as the connections are made between the new and old works, they will commence taking out ore. The Township mine is soon expected to start up, when, with good management, the mine can be made a paying institution. There are several other mines steadily at work, but with what success we are unadvised.

AMADOR COUNTY.

Jackson *Ledger*, Feb. 27th: The mill of the Coney & Bigelow mining Co. has been shut down for the purpose of making some needed repairs.

The Alturas mine, four miles above Volcano, is proving to be very rich. They have just finished crushing a run of 60 tons that yielded a little over $35 per ton.

The S. F. *Herald*, March 2d, says: A letter from the Amador Mine, dated the 26th, says the north shaft continues to improve as sinking goes on. From the mine there is but one uninterrupted succession of good news.

EL DORADO COUNTY.

The *Herald* of this city, of March 2d, has the following: The Pacific Co. have shut down their mill to add another battery. The mine is looking well and showing good signs of improvement as the work progresses, as to warrant this addition to their mill. The ore is said to pay handsomely, which is encouraging to the quartz interests of El Dorado, which for a long time have been in a languishing condition.

INYO COUNTY.

San Diego *Union*; Feb. 13th: Fourteen thousand pounds of bullion arrived in this city yesterday in charge of Gray, Bro. & Arcado, from the Cerro Gordo mine.

MARIPOSA COUNTY.

Gazette, Feb. 26th: During the past week a large boiler, smoke stack and other portions of machinery, have been brought into Mariposa by the Company, and will immediately be placed in working order for the purpose of pumping the water out of the mine. Quite a number of hands will soon be at work on the mill below town, and it is to be repaired as speedily as possible.

The Washington mill and mine is situated about one eighth of a mile West of Quartzburg, and is owned by Page & Co., of San Francisco. At present the mine is worked from a shaft 265 feet in depth, the vein averaging from seven to ten feet in width, and the ore yields from $20 to $30 per ton. Three miners and three strikers are sufficient to furnish an abundant supply of rock to keep the mill constantly running. It is a ten-stamp mill and crushes over ten tons of rock every 24 hours. The ore is raised to the surface directly in front of the batteries, where the spalling process is performed by two Celestials. The water to supply the batteries and the boiler is raised by a pump of five feet stroke and eight inch bore, and the hoisting works, pump and mill are all driven by an engine of two feet stroke and nine inch bore. This engine was obtained at the Miner's Foundry, San Francisco. After a run of two weeks the mill was cleaned to-day, and 160 ounces of amalgam obtained, which will return about $12,400 in coin.

NEVADA COUNTY.

Transcript, Feb. 23d: The weather has been exceedingly cold for the past few days, freezing up the ditches and putting a quietus on the operations of miners. A valuable tail sluice, in Sweetland creek, was recently sold by Stephen Spencer & Co. to Evans, Stidger & Co. for $20,000. This property is located below the claims of Evans & Co. and is the outlet for some of the most valuable claims in Bridgeport township, situated along the gravel range from Buckeye Hill to Birchville.

Feb. 25th: The repairs on the Blue Tent reservoir, which was broken during the late storm, were completed yesterday. The break was caused by a gopher.

We understand that satisfactory arrangements have been made between the mining companies that have an outlet through the flume running through the city, and the property holders, and that the flume is to be built by the companies from the Masonic building to Deer creek.

Feb. 26th: The prospect for a prosperous Spring among miners in this county is exceedingly excellent. The snow in the mountains will furnish abundance of water for many months, and our miners are generally satisfied that it is foolish to leave Nevada county, where the value of the mines is fully demonstrated, for any place of uncertain resources. The weather is now excellent, and if there is no more severe weather miners will be in the hight of prosperity in a short time.

Leavitt & Co. yesterday commenced work on the flume which is to be the outlet for their mining claims from the Masonic building, under the houses on Commercial street, to Deer Creek. It will be completed and the miners will resume operations in a short time.

Gazette, Feb. 24th: Robert Irving, J. C. Duel and others have located 2,500 feet on a quartz ledge situated on Worthington's ranch, Grass Valley township. William Dawes and others, under the name of the Imperial Quartz Mining Co., have located 2,000 feet on a quartz ledge on the south side of the Nevada and Grass Valley Turnpike.

Feb. 25th: The Eureka Mining Co. shipped on Tuesday $33,000 from Grass Valley. Of this sum, $24,000 was the yield of two weeks' run of the mill, and $9,000 was from the yield of sulphurets from the mine.

We understand from a gentleman over from Birchville that the Keunebec Co. at that place have recently cleaned up, after five days' run, $8,000.

Feb. 26th: We saw yesterday, at the Sneath & Clay mine, a considerable quantity of good rock which has recently been taken from the lower north level.

Grass Valley *National*, Feb. 23d: A contract has been let for sinking 100 feet on the Crescent Ledge, Kate Hayes' Hill.

Everything at the Sebastopol Mill is moving along smoothly, with immense piles of rock in waiting to be reduced to a gold basis. Eighty loads from the Ben Franklin, near the Ione ledge, are now being put through. The last crushing paid as high as $40 per load. The company are down on their ledge 100 feet and the rock is looking better than ever before with the ledge ranging in thickness from 14 to 18 inches. From the Lamarque ledge, located on New York Hill, 120 loads of rock will also be crushed. The last crushing paid over $40 per load, and it is thought this ore will average $50 per load. We also saw an immense pile of rock from Gregory & Mausau's ledge, on Osborne Hill, to be put through the batteries. Some lively betting is going on as to how much it will pay per ton, but it is generally conceded that it will be in the vicinity of $100. Things certainly look very encouraging for a lively and prosperous mining season in Grass Valley, so much so, that many who had the White Pine fever are wisely concluding to stay at home and invest their coin where there is a chance of having a return for it.

Mr. Nash, just arrived from Eureka South, says: At Moore's he found the snow four feet deep, but melting very fast. Several of the mills at Eureka are busy at work, among the number the Birchville, New Era, Young & Stacy's, Mutual, etc. The rock from several of the ledges is looking well and paying as well as any in the county, considering the depth the companies have prospected.

Feb. 22d: The Hope Gravel Co., on Alta Hill, are still hard at work developing their mine. Recently a contract was let for sinking a shaft 230 feet at a point 1,000 feet west of old works, where the company have been operating for three years past. Wm. Paul & Co. took the contract for $9 per foot. The size of the shaft is 12x14 feet—divided into three compartments, two "hoist-ways" and a pump-shaft. The shaft has been sunk about 50 feet so far, and the work is being prosecuted with considerable energy. From the old shaft, 4,000 feet east of the new one, the company have drifted to a point near the new shaft which is being sunk to facilitate the development of the mine. The gravel bed is about 200 feet wide, running east and west, and the new shaft, when completed, will open up enough ground for at least two years' work.

Feb. 24th: The Brown Brothers have suspended operations, at their mill, on Wilcox Ravine, near You Bet, in order to overhaul their machinery and make repairs.

Grass Valley *Union*, Feb. 25th: During the late heavy snow storm at Graniteville the following quartz mills kept continuously at work: The Mutual, Birchville, Norfolk, Jimcrack, and Black and Young's. The Black and Young mill is running on rock from the Banberry ledge, and the clean-ups prove very rich. An active and prosperous season in quartz mining is anticipated at Graniteville the coming summer.

EXCELSIOR.—The Gold Hill *News* has the following from the Excelsior mines: Joe Ravelle, recently returned from Meadow Lake, gives us the following items relative to Excelsior District: The Mohawk and Montreal mine is steadily being worked. The tunnel from the level of the mill of the company is steadily progressing toward the ledge, which it will intersect at a depth of 400 feet beneath the croppings, thus affording a grand chance to extract ore to the greatest advantage at all seasons of the year. The Pacific Co. also propose commencing work soon; also the Independent. The Enterprise mine and mill are still idle, with a man there in charge of the property. The company will probably commence operations again when the snow goes off. The Lake Co., about a mile southeast of the town of Meadow Lake, has developed a valuable ledge of rich gold-bearing rock, three feet in width, and has let a contract to sink a working shaft on the same—the contractors to take the rock extracted during five months in sinking said shaft for their pay. The shaft is already 35 feet in depth, with a good house erected over it.

PLUMAS COUNTY.

Quincy *National*, Feb. 13th: A correspondent at Snake Lake writes: Lile Jacks (Smith & Co.,) has again brought water on the old Badger Hills claims, after building a large reservoir up Hill's ravine, and cutting and digging a new ditch, over a mile long, and a large portion of it in hed rock. It will carry 600 to 700 inches of water. Squire Jacks is also waiting the tapping of the clouds by a warm rain current. John O'Brien and McDougal, at New Boston, are pitching into Goodwin Point, with a prospect of better diggings as soon as they can get to the bottom of the channel. From present indications it will pitch below the present running creek. They have flattering prospects. Metcalf and Haycock have not yet got a good head of water, but are ready when it arrives. Jenkins, Richards & Co., on the Wah-pon-see Hill, and Colman on Pine Leaf, are doing a good business, considering the lack of water. Maxwell & Copeland, in the bed of Wah-pon-see creek, are beginning to make things look in "ship shape" order for a lasting claim. Their propects are good. John Ball, at Logansport, will make the thing shell out this summer, judging from the prospects. Tommy Taylor, on Wet Hill, and Trimble, on Gambler's Ravine, are still following good prospects, drifting, and waiting for water to do something better. Riddle, of Soda Bar, is making things look lively around his camp. Bob Holmes and Hugh McLawland, at Dutch Bar, have diggings, and lasting ones.

The Caledonia Co., at Cherokee, has struck extra good pay rock, has put on several work hands, and is doing very well. Judkins & Kellogg's mine is looking better than it has for a long time. In J. Blood's Indian Valley mine, they have struck extra good rock in one of the several gold bearing chimneys. The mines are, on the whole, looking up. Bidwell is putting the Waterworth mill in running order again. The Crescent is a *quien sabe* case. Shorkly and Cook have sold their interest in one of the Cherokee quartz ledges, for $2,100, to Bidwell, and an interest in another lode for a big sum, figures not known. The Cherokee mining district is one of the best in Plumas county, when it gets to be thoroughly opened and worked in a scientific manner.

SISKIYOU COUNTY.

Yreka *Union*, Feb. 20th: The Oak Grove Co. are doing well in their claim on McAdams Creek. Carroll & Co have suspended operations for a few days, but will soon be at work again.

TRINITY COUNTY.

Weaverville *Journal*, Feb. 27th: We understand the flume across Brown's creek, near Davidson's mill, will be completed and conveying water to Douglas City by the first of next week.

A miner, whose name we have been unable to learn, found a piece of gold weighing three pounds, last week, near Trinity Center.

Paulsen & Co. have a ditch full of water and are briskly at work in their claim at Smith's flat.

YUBA COUNTY.

Marysville *Appeal*, Feb. 28th: We learn that the Jefferson mine, at Brown's Valley, has been working old ground for some months past, and doing very well. At the same time the Superintendent has kept up prospecting. One drift has been run westwardly into the hill.

ARIZONA.

Prescott *Miner*, Feb. 13th: A piece of gold weighing $26 was found at the Placeritas, near Walnut Grove, in this county, a short time ago.

BRITISH COLUMBIA.

A despatch from Victoria, dated Feb. 15th, says: Late mining news from Carriboo is very favorable. The weather continued mild and all the principal mines were paying well. A movement was on foot to organize a company to prospect the meadows on Williams Creek.

The steamer *Sir James Douglass* arrived at Victoria, March 1st., from Nanaimo. She reports that there are 10,000 tons of coal ready for shipment at that port.

The Vancouver *Register* says: M. Eaton, on Lewis River, has discovered a number of lumps of gold, recently, varying in value from twenty-five cents to a dollar and a half. He declines revealing the place of their discovery till he makes some further explorations.

COLORADO.

Georgetown *Miner*, Feb. 4th: At the Brown mine, which we visited a day or two since, we found work progressing favorably in the adit, which is now 200 feet in length, the vein carrying from 8 to 14 inches of mineral; in one place, where we measured this vein, it was full 18 inches in width. The mineral has been improving for the last 20 feet, carrying more galena and less blende.

At the Coin lode we also found an adit in progress, which is now 65 feet in length. The pay vein averages 14 inches in width, four inches of it being solid mineral, and the balance a rich gangue, carrying native silver in abundance. On Sunday last they took off, at the works, 4,356 ounces of silver bullion, coin value $5,662. The run was from 20 tons of Brown ore, and gave an average yield of $283.10 coin value, per ton. The cost of reduction was $10 per ton, and 94 per cent of the fire assay was saved.

IDAHO.

Owyhee *Avalanche*, Feb. 20th: The Ida Elmore is being rapidly put in order. The Golden Chariot is yielding large quantities of ore at this time, which has diminished none in the richness of quality.

The Poorman looks more permanent, and is in better working trim now than at any time since its discovery. The ledge ranges from 1½ to 3½ feet in width, and is producing an excellent quality of ore. The new hoisting machinery works well. There is quite a pile of ore in the dump.

The Peck & Porter mine is developing well, the ore resembles that of the Ida Elmore and Golden Chariot. We were shown by Mr. Peck a large specimen extracted from the mine, literally speckled with gold.

The Baxter mine is turning out well.

Silver City *Tidal Wave*, Feb. 19th: Hiram Gove and John Hildreth, have left with us some excellent specimens of South Mountain ore. One piece from the "Original," shows almost every metal known to this region, but is especially rich in silver, lead and iron, the other is from the Galena ledge, and abounds in silver and lead. Many assays have been made of these South Mountain ores, all of which have proven very satisfactory. Certainly the specimens in our possession present an appearance of richness quite equal to those shown us from White Pine, or elsewhere.

The Boise *Statesman* says: A friend lately from Lewiston informs us that considerable interest is taken in a new discovery of rich placer mines in a branch to the Bitter Root Range, and that a number of the citizens of that neighborhood are preparing to

visit that country at an early date. There is a very extensive country through North Idaho, which has never been much prospected, which will some day be opened up to a large mining population.

NEVADA.

REESE RIVER.

Austin *Reveille*, Feb. 25th: Yesterday the First National Bank of this city shipped overland to New York city five bars of bullion, the product of the Belmont mill. The bullion was the product of ores obtained from the mines of Col. Buel in the district of Silver Bend.

WHITE PINE.

The country papers are filled with letters from parties now at White Pine, all bearing the same tenor. The snow covers the entire country, so that prospecting to any great extent is out of the question. All look for lively times in the spring. The country is filled with persons ready to start out on the first symptoms of spring, to more thoroughly prospect the adjoining country, and many are still arriving. We give below the latest from this section.

Treasure City *News*, Feb. 20th: Considerable activity has been manifested in mining matters during the past week, and several important transactions have taken place. The Seymour and adjacent mines, situated under Pogonip Flat, were sold to Mr. George Hearst, an old pioneer silver miner, for the sum of $95,000, which sum is believed to be not one-tenth of its real value. Unlike most of the mines here, the Seymour, (or rather the Silver Treasure, as it is to be called hereafter,) shows a true and distinct fissure vein, with both hanging and foot walls. It is about twenty feet in width, and shows as uniform a record of assays, and averages as high, as any mine in the country.

A very rich chamber of ore has been struck in the Progress mine, on Chloride Flat, which bids fair to be both rich and extensive.

The Illinois Co. have commenced work again in good shape. They have workmen engaged sinking a shaft on the vein, and purpose sinking until they get as good ore as that of the Eberhardt, and from present indications there is not the least doubt but what they will. This claim is situated on Silver Glance Hill, about 2,000 feet directly east of the Eberhardt mine, and 200 feet east of the Silver Glance. The location is excellent, and in a very short time it will be one of the prominent mines of this District.

According to the Austin *Reveille*, 613 pounds of bullion arrived from Hamilton on Feb. 22d, 209 on the 23d, and 202 on the 25th.

The Virginia *Enterprise* says: We conversed with a person yesterday who saw at White Pine several of the men of a party which had returned from a prospecting trip to the eastward, bringing specimens of silver ore and a very meagre description of the country. Our informant stated that the ore is chloride of a superior quality, and the prospectors said that it occurred in great quantity. Their explorations were cut short by a severe snow storm, and they were compelled to abandon the place in haste, but they intend to return with the first approach of summer. Of course the prospectors did not give an accurate account of the locality where they made the discoveries, and only stated generally that it was near Egan Cañon, or about 65 miles east of Hamilton, White Pine. There are several organized districts in that direction which were discovered years ago. The Hercules district is situated in the Egan range of mountains, about 160 miles nearly east from Austin, and bordering on the fine and extensive Steptoe valley. Many veins or deposits of silver ore were reported to exist in the district, and were located by the discoverers. It was also said that copper ore occurred in limestone in some parts of the district. All the prospectors that visited this section united in saying that Steptoe valley, with its numerous streams of water and lush meadow land, is the garden spot of Nevada. Further southward, and lying directly on the route from Pahranagat to White Pine, is the Robinson district, which is said to exhibit extraordinary peculiarities in its mineral occurrences. Copper, silver, lead, and gold ores, were reported as abundant. There are entire hills apparently of copper ore, and there are distinct veins of fluor spar in which occur cubes of galena. We have seen specimens of the silver-bearing ore reported to be from the Robinson district, which were of excellent quality. About 170 miles east from Austin lies the district of Egan, or Gold cañon, as it is sometimes called from the occurrence of gold in the quartz. It was discovered in 1863, is very accessible, and is well supplied with water; but outside the property of the Social and Steptoe Co., there is very little development in the district. The Kinsley district is situated in the Antelope range of mountains 40 miles northeast of Egan canon, and 200 miles from Austin, on the eastern border of the State. The peculiarity of this district is the many massive veins of copper-bearing ore. Samples of this ore taken from the surface is represented to have yielded by assay from $60 to $100 per ton in silver. We believe the Central Pacific Railroad will pass through the Kinsley district. Directly south of White Pine and in the same range of mountains are the lately discovered districts of Grant and Troy, in both of which fine silver ore has been discovered. In this vicinity, in a radius of perhaps 60 miles, there is a plexus of veins and deposits of silver ore of immense value, which will reward the labors of the prospector, who may fail to secure anything in overcrowded White Pine. Possibly the reported new discoveries may be in some of the districts we have mentioned; or they may be original and in the same direction.

A correspondent writes: There is no doubt but that the mines here are very rich, as far as they have been developed, but as yet none have been sunk upon to any great depth. The ore is found almost everywhere by sinking a few feet in the limestone, but the whole country around has been located, and wherever chloride has been found the holes are so thick that the rock can hardly be thrown from one hole or shaft without falling into another. Everybody here is on the sell. If a prospector goes out and strikes "chloride," as they say, he is at once worth in his own estimation from $10,000 to $500,000, even though he has not a dollar with which to buy a square meal.

A correspondence published in the Havilah *Courier*, dated Silver Springs, Feb. 1st, says: Medherry is doing well, and is greatly encouraged. He was working a claim in company with Ed. Emory. He found pure silver on the top of the ground, and it raised a great excitement. He pays $5 a day for hands. The day before he wrote he had two tons of rock carried six miles to a mill—the transportation costing $40; he thinks the rock will pay $3,000 a ton. A great influx of population is expected at White Pine from all parts of the United States. The mines are not held at so high a figure as formerly. There are a good many rich mines there, but not enough to give the population a foot each. There are only 25 stamps there, and those not working, but if all mills spoken of are put up there will be at least 30 in the spring. So far, with one exception, the mines that have been sunk on have turned out poorly below 40 feet.

In regard to mining developments, says the *Bulletin* correspondent, it may be stated that while the older claims, such as the Eberhardt, Hidden Treasure, Stanford, Aurora, Pocotillo, Virginia, and the leading claims on Chloride Flat, are exhibiting increased signs of wealth to the extent of further exploration, a great number of mines ranking here in the third and fourth classes are affording the utmost satisfaction upon being opened. In this category we have now coming into prominence the Mazeppa, the Copper Glance, the Pennsylvania and the Featherstone, all of established value, while the Hornet, California, Emersly, Charter Oak, Poorman, Illinois and the Independent, with some new strikes about Pogonip and Bromide Flats, fall into a class but one grade lower; two or three of them being by some esteemed equal to either of the three first mentioned. From all these claims, ores—and in considerable quantities—are now being taken. From the Belle Chloride, Plata Pura, Argyle, Umatilla, Coulson, Neptune, and perhaps a hundred other lodes, the names of which do not occur to me, fair milling ore is being raised in moderate quantities, while the multitude of shafts sunk on Chloride Flat continue to yield their usual complement of rich ores. Among the rising claims of the district, the Hornet seems just now to be most conspicuous. The lode is large, very regular and highly metalliferous, though the assays do not run extremely high. Some rich developments recently made on the California lode is causing it to be the theme of much conversation in mining circles here. This mine is situated a short distance southwest of the Eberhardt, and, at a depth of less than 20 feet, is yielding ores that assay equal to the Eberhardt, and have milled nearly $400 per ton. Thus one mine after another becomes conspicuous, and, passing upon the list of properties of recognized value, is afterwards not much more heard of. A rich strike in the Hidden Treasure mine, whereby a body of ore milling $400 per ton has been laid open at a depth of 80 feet, is also reported. This, if true, will prove a significant fact, as establishing the continuance of the rich ore channels at this considerable depth.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Virginia *Enterprise*, February 24th.] The Twin mine, Silver City, is yielding a very considerable amount of pay ore, but it is all being extracted at present from above the water level, as the pump in the lower part of the mine has been removed to give place to one of greater capacity, which will soon arrive. The best ore is below the water level.

The Bacon will start up on ore from the Hale & Norcross mine in a few days.

The mill of the Gold Hill Mill and Mining Company started up day before yesterday on ore from their tunnel, dumped by means of the new car track directly into the mill.

The Ophir Co. are again at work at their new shaft. They are running a drift to the westward from the bottom of the shaft.

Feb. 25th: The work of retimbering the paved portion of the Gould & Curry shaft will be finished about the middle of next month.

The Cole Co. is still hard at work, and have out a large lot of rock which will be hauled away for crushing as soon as the snow leaves the side of the mountain.

Work on the Julia mine is being vigorously prosecuted. The shaft is now 350 feet in depth, and from this level two drifts are being run, one east and the other west, to tap two ledges which the company claim to own. They suppose they have from 50 to 60 feet to run, before striking their east lead, and 40 to 50 to carry them to their west vein. In the west vein some fine "stringers" of quartz have been cut, from which assays running from $10 to $12.72 have been obtained.

Feb. 26th: The Yellow Jacket mine is at present looking better than before in its history. There is plenty of good ore in sight almost everywhere from top to bottom.

Feb. 29th: In drifting upon the west view on the two hundred-feet level of the Justice and Independence mine, it has been found to widen out, till it is now some ten feet across, and several assays, averaging about $100, have been obtained from it. There was considerable excitement in regard to this strike yesterday.

MONTANA.

Helena *Post*, Feb. 5th: A party of Germans, last week, discovered a small and very rich gulch one mile west of Blackfoot City, which prospected from 25 cents to $1 to the pan. From a pit eight feet square $400 was taken out with a rocker. The new discovery has been staked and is being actively worked.

The miners on Ophir Bar have been working their claims all winter, and have a promise of good times in the spring, as there is more snow in the mountains at the head of the streams than at any time last winter.

A lump of retort weighing 14 ounces, the result of four days' run in an arastra from 250 pounds of rock from the Johnson & Stanton lode, Brown's Gulch, has been brought to Virginia City. This lode is four feet wide and has a shaft 30 feet deep upon it.

We saw yesterday at the assay office of S. F. Molitor a gold bar worth $4,097.07, the result of a clean up in the Diamond City 10-stamp mill, on Saturday last, from 160 tons of unselected ore, product of the Whitlatch Union mines. This rock was taken from the bottom of an incline 175 feet in depth, at which point the ledge presents a face of splendid quartz five feet in thickness. The workmen have now been engaged in this rich deposit some two weeks, and it retains all the characteristics of permanency and value which have pertained to it from the first. Numerous specimens of free gold bearing rock have been procured from it which compare favorably with any that have ever been found on the Whitlatch Union lead.

The Bannack correspondent writes: Men are doing well rocking along the old bars these warm days. Quite a number are working in the bed of the creek, and are bringing to light many tubfulls of good pay dirt. Other ditch companies are making preparations for mining in the spring. Of the various discoveries that have been made the past fall we will speak of only one. That is a lead in the Blue Wing District, about three miles from Bannack, named the Brick Pomeroy. It was discovered by Bassett & Ney. It is amalgamating silver-bearing rock, and rich. The lead at the point where they are sinking is 15 feet wide. There is now enough quartz in sight to keep a twenty-stamp mill at work till it wears out.

Same, Feb. 12th: The Diamond City mill, situated in Grizzly Gulch, is now engaged in a run upon rock from the Wisconsin lode, and we learn that the amalgamating plates give evidence of a greater yield than from any like run ever before made in the Territory.

The Boulder diggings—the first discovered in the Territory, and the center every year since, of a new excitement—again loom into importance. The prospects are brighter now, we think, than ever before. The bars originally discovered have been constantly mined, yielding from $8 to $10 a day to the hand; and good prospects have been obtained on the opposite side of the creek. Then five or six miles lower down are several small gulches prospecting well for hydraulic diggings, besides the bars on Burkius' place, which are to be developed the coming spring.

From A. J. Smith, lately arrived from Bannack, we learn that every one in Bannack is employed in some manner. Some are drifting and extracting pay dirt to sluice when then water runs; some are repairing ditches and others are opening up claims for active mining in the Spring. It is his opinion that there will be over twice as much gold taken out in Bannack next summer as there was the one just past. Horse Prairie, 30 miles from Bannack, is destined next summer to be one of the greatest gold producing mines of any placer diggings in the Territory. The pay ground is very rich and covering a large surface.

Active preparations have been going on all winter in the tunnel which is being run across Hunter's Bar. The bar is some 400 feet wide, and this tunnel is being run across the channel, keeping on the bedrock which slopes from the rim-rock to a depth of 17 feet, at the distance of 300 feet, the length of the tunnel. This bar is some 2,400 feet long and is from 9 to 18 feet deep, containing good pay from the grass roots to the bed rock. It is supposed that it is the old channel of Confederate Creek.

The Granite Mountain Co., in Tucker's Basin, have run a tunnel over 300 feet in length on the Granite Mountain Lode, and extracted a large quantity of rich pay quartz. Another tunnel, 210 feet in length, has tapped the Levi Blossom at a depth of 70 feet. Shafts respectively 60 and 75 feet have been sunk in the Winscott, Munson and Merritt Lodes, and developed true and permanent veins. As high as $2.50 to the pan has been repeatedly taken from a single panful of the crevice dirt. On the discovery claim of the McClellan Lode a shaft and two tunnels have been excavated. The vein exposed in their workings is 12-15 feet wide, with well defined walls. Actual milling results, as well as numerous assay returns, have shown that every portion of the vein matter contains free gold in largely paying quantities. Numerous runs made on the quartz from this district in the mills at Unionville have yielded as high as $78, and none less than $15 per ton.

OREGON.

Jacksonville *Sentinel*, Feb. 13th: Duffy & Co., at Pickett's camp in Josephine county, are taking out an ounce per day to the hand. Water plenty and ground unlimited.

WASHINGTON.

New Coal Fields.—Edward Giddings, Esq., Chief Clerk of the Surveyor-General's office at Olympia, (W. T.), informed the editor of the Oregon *Herald* that parties have recently discovered the largest and deepest coal beds ever before found in that Territory, located near the military road between Claquato and Shookum Church. He, together with three others, have entered 1,400 acres of land covering this mine, and he is on his way to New York to negotiate a sale of shares therein. The discovery is said to be the most important of the kind yet known, and he seems quite sanguine that its proceeds will yield an immense reward.

WYOMING.

A correspondent writing from South Pass City to the Nevada *Gazette*, under date of Feb. 1st, gives the following: Tozer and Eddy's mill suspended operations about the 1st of November, after an exceedingly rich run of four months. The Miner's Delight mill (steam) commenced running with ten stamps on the 14th of January, and cleaned up $8,000 after a 12 days' run. Anthony, of Colorado, is bringing a ten stamp quartz mill into the country. The Young America Co. are getting out timber for their mill building. The mill is to be here as early as possible in the spring. Arrangements have been made for procuring other mills. Developing and prospecting goes bravely on. Of the several important discoveries made recently, the Nellie Morgon lode is perhaps the richest. The times are good. Wages for miners are five dollars per day.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, March 6, 1869.

Notices to Correspondents.

VELOCIPEDE.—The title originally applied to this machine was exactly the same as the one which you have assumed as a *nom de plume*. We are informed, however, that soon after their introduction they were contemptuously called dandy hobby-horses, and sometimes for briefness, "hobby-horses." The same informant states that the newspaper paragraph which dates the history of the introduction of velocipedes to the days of Pitt, Fox, and Sheridan, is equally erroneous, none of those having ever had the opportunity of witnessing one of the machines, much less of having made spectacles of themselves by being seen astride of them in the London Park. Velocipedes were not brought into public notice until after the battle of Waterloo, (1815) by which year all the statesmen named had departed this life.

PROTOZOAN, Napa County.—Silicious formations composed of the exterior coatings of minute organisms similar to those you describe, generally are to be found in many geological formations, especially over our Cretaceous ones. They appear to have existed during all time, and continue to exist, for Ehreuberg calculates that there are formed annually in the mud deposited in the harbor of Wismar, on the Baltic, 17,496 cubic feet of silicious organisms. These silicions infusoria are said to form a mouldy covering, about half an inch thick, upon stagnant water during warm weather. Although it has been calculated by the microscopist named that one hundred millions only weigh one grain, yet he has stated in *Poggendorff's Annals* that he has collected as much as one pound in the course of an hour.

B. P.—Becquerel found that when laminæ of gypsum were immersed in a very dilute solution of silicate of potash in a loosely covered vessel, the atmospheric carbonic acid gradually decomposed the silicate, and the carbonate of potash converted the sulphate of lime into carbonate. At the same time granules or laminæ of silica separated, which was capable of scratching glass, and contained 12 per cent. of water. Very thin laminæ, of the same hardness, were found at the bottom of the vessel; when acted upon with a hot solution of carbonate of potash, they left transparent laminæ, which, when examined with two of Nichols' prisms, presented the colors peculiar to doubly refracting crystals; from which it was inferred that they were quartz.

A. L., Washington District, Idaho.—Your very acceptable account of the permanent mining that has developed itself in the Salmon River country, is received, and will appear in our next issue.

THE SUEZ CANAL.—Mr. Lange, the English representative of the Suez Canal Company, announces that the canal will be "completed and open to the general navigation of all countries on the 1st of October, 1869."

Time by Telegraph.

Professor Davidson, of the Coast Survey, is making a specialty of telegraphing time, or, in other words, of determining longitude with the aid of the telegraph; and his operations at his temporary observatory on one of the public squares are, if our daily contemporaries are not overdoing it, calculated to "attract the attention of the scientific world." The American method of determining longitude has the merit of being very simple, and accurate; but it is not very new, and the probability does not appear very great, as one might be led to suppose from reportorial accounts, that Professor Davidson is about to inform us that we are actually in a different part of the world from what we have imagined ourselves to be in.

It is eminently practical, and very meritorious on the part of Professor Davidson to place time telegraphing on a good working footing on this coast and in connection with our great unsurveyed interior, where the telegraph wire passes through countries whose position has not yet been located on the map, and where the traveler in possession of the best existing data is more likely than not to find himself from ten to a hundred miles out of the true reckoning. Every telegraph station in the land may thus be used as a surveyor's starting-point, so far as the longitude is concerned; the latitude being quite easily and accurately obtainable by means of the solar compass, or sextant.

As a preliminary to the above practical ends, Professor Davidson has been experimenting in the telegraphing of time to the greatest distances at present within the command of the telegraph. Two obstacles are encountered: waste of electric power in the moist air on land-lines, from imperfect insulation; and in ocean cables, or in the case of perfectly insulated wires, the melting of the cable or wires on the application of the same powerful current that is made use of on land. The former difficulty is easily overcome by means of a dozen or so telegraphic repeaters; the latter renders the problem at present impracticable to telegraph time reliably any farther than to Newfoundland.

The instrument made use of in telegraphing time is the chronograph, which is thus described:

Essentially, it is a revolving cylinder, propelled and regulated by clock-work. It is covered by a sheet of white paper, and when revolving, a continuous spiral line is traced by a pen, connected to the armature of a small magnet in the local circuit, passing through the clock. At each oscillation of the clock pendulum the circuit is ingeniously broken and the armature relieved, causing a lateral movement of the pen. This break lasts about one-twentieth of a second, and when the circuit is again complete the pen resumes its former position in the line. By an insulated prolongation of this pen armature, a break is also made in the main circuit leading to Cambridge, and is recorded on the chronograph alongside the clock pen of that observatory. Thus there are two pens recording simultaneously on the chronograph—that of the Cambridge Observatory making a black line, and the other, of the local clock, tracing in red. Signals are transmitted each way for five minutes, and each observer sends word to the other of the hour and minute of the five-minute work accomplished.

Each stroke of the pendulum makes a break in the mark, and the length of the space between the commencement of the break in the red line and the commencement of the next break in the black line shows the variation between the clocks, and, supposing their time to be accurate, the longitude, after allowing for the time lost by the current in traveling. On Sunday night two wires were used, and the current from San Francisco passed through Cambridge, 3,500 miles distant, and returned here, making a journey of 7,000 miles in eight-tenths of a second, the greatest length of wire ever used for a similar purpose.

Since 1852 Professor Davidson has made three hundred independent determinations of longitude at San Francisco and other points on the coast, by the ordinary astronomical and chronometric methods in use in the Coast Survey. The telegraph must confirm the results taken from the sun and stars. As the sun travels a quarter of a mile in a second, the minuteness to which longitude can be determined telegraphically with the aid of the chronograph is, theoretically, about to a Gunter's chain, or sixty-six feet.

DRY BARREL AMALGAMATION.—Mr. A. B. Paul, at the Miners' Foundry, and Mr. Hester, at Mosheimer's works, are both using and experimenting in a dry barrel amalgamation process, for the reduction of sulphurets, etc., the results of which are claimed to be very flattering. The former has had his process in operation for several months, and has been making careful assays of the work, but has interdicted newspaper mention of the process until he should be in a position to present his results in a more tangible shape. In principle this dry barrel process appears to be very similar to the Ryerson process. Mr. Hester's machinery and process are thus described in the *Times* of March 1st:

It consists of three barrels, one of cast iron and two of wood. The iron cylinder is about half filled with sulphurets or pulverized ore, and revolved over a moderate fire for one hour, keeping it below a red heat. The ore having been thoroughly heated through, is drawn out into a wooden cylinder, and 10 per cent. of quicksilver added, and the opening then made air-tight, to prevent the fumes of quicksilver from escaping. After revolving for two hours, the ore and quicksilver are found to be intimately mixed together, and the gold and silver amalgamated. The charge is then drawn off into the third barrel and diluted with water, and after revolving for two hours the quicksilver and amalgam are drawn off. The secret of this process is in this last barrel, used as a settler, for, in every instance, with the most refractory arsenical sulphurets, and with combinations of lead and iron, the quicksilver is found at the bottom, collecting and forming an amalgam containing nine per cent. of the gold and silver, while the only appreciable loss in quicksilver in a month's working was what was spilt by carelessness outside.

STATISTICS OF NEVADA SILVER PRODUCTION.—The Comstock lode produced,—according to statistics given in the *Commercial Herald*,—up to April 1st, 1866, $51,380,580; since then an average of $11,000,000 annually, or a total of $85,000,000 to the first of April, 1869. The Gould & Curry, from 1860 to 1866, yielded $13,626,871, from 230,546 tons of ore, or $59.02 to the ton, the content afterwards falling off to $18.14. The Savage yielded in seven years preceding July, 1868, $11,327,700, from 270,521 tons of ore, or $41 to the ton. The cost of reduction at Virginia City was originally about $30 to the ton, and now stands at about $20, where it will remain until cheaper agencies, or methods, are introduced.

From Lander County (including White Pine) a three months' return ending December 31st, 1868, shows that 49 mines have produced 2,493 tons of ore, yielding $870,554.45, or an average of $349.20 to the ton. With the possession of the Comstock Lode and the White Pine District, Nevada can "flourish her silver scepter in the face of all the world."

THE *El Dorado*, edited, published and printed by ladies of this city, has made its appearance, and is running the gauntlet of criticism. To those who may see the *El Dorado* the fact will be of interest that its attractive engraved head, representing the Golden Gate and ships at sunset, was also executed by a young lady.

THE *Conducta* which left the City of Mexico about January 28th, for Vera Cruz, took over three millions of dollars down for exportation, on which eight per cent. export and circulation duties were paid.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

The Rivot Hydrogen-Burning Roaster.

The proprietors of the Rivot revolving iron cylinder patent, for the roasting of sulphurets with the aid of hydrogen, seem to have more than presumptive or theoretical evidence of the practical success of that process, in point of economy of roasting, judging from the enormous expense that the moneyed men in the business have felt justified in going to, in the French Company's extensive works at Canada Hill, near Nevada City. The transportation of the casting (weighing 21,600 pounds), from Colfax to Nevada, a distance of fifteen miles, has alone cost from $1,000 to $1,500, it having been found necessary to strengthen the bridges on the way; and the same company has already expended, on the works at Canada Hill, for the treatment of sulphurets by the Rivot process, about $100,000. We may look, accordingly, for an important success, or for a more than commonly remarkable failure. The claim is that gold can be extracted within 4 per cent. of the assay, which may be very correct, that being more a matter of proper roasting than anything else; but the important consideration in the case is the comparative cost, in regard to which we shall probably be enabled to inform our readers more definitely soon. Some idea of the working of the cylinder roaster can be gained from the following, in the Nevada *Transcript*, of March 2d:

It is fourteen feet long, and the space intended for the furnace is ten feet in length, and five feet in diameter. This space has eight or ten triangular projections, which are intended to throw the sulphurets towards the center of the cylinder as it revolves. The casting is to be rigged on machinery, and at either end it will be closed. It is intended to revolve slowly, while the sulphurets are charged with superheated steam and roasted.

MACHINE WORK AT SACRAMENTO.—We learn from H. F. Root, of the Union Foundry, Sacramento, that the machine and foundry work is now quite brisk. Messrs. Williams, Root & Neilson, have orders on hand for two 14-inch engines, 5 feet stroke, for C. S. N. Co.; a pair of 12-inch cylinder and 4-foot stroke engines, for steamer San Joaquin, owned by a joint-stock corporation, known as the Towing Company, to run on the Sacramento River; a 14-inch cylinder, 30 inches stroke, for McCreary's new flouring mill, on Front street—the above engines all to be furnished with Cross' patent boiler-feeder, and sediment collector; a quantity of saw mill work for Jones' mills at Truckee, State of Nevada; besides a large lot of miscellaneous jobbing and manufacturing. Mr. Root also mentions that mechanical business, and most trades and manufactures, are progressing lively in the "city of the plains."

HORIZONTAL REVOLVING AMALGAMATION BARRELS.—At Gold Valley, Sierra County, amalgamation barrels are used, made of pine wood, and revolving horizontally like a butter churn instead of vertically like the Freiberg barrel,—twenty revolutions per minute, for about twenty hours to the charge. It requires three barrels (four feet long and two and one-half in diameter), to do the work of one pan; but the latter is said to cost ten times as much, and requires twenty times as much power.

SNOW BELTS IN THE SIERRAS.—A writer in the *Union* attempts to show that there are four transverse snow belts in the Sierra Nevada range, between each of which the fall is slight and the obstacle to railroading, on that score, insignificant. The causes he thinks are independent both of altitude and latitude. One of these belts is at latitude 37° (Yosemite Valley), not extending as far north as the Sonora Pass; another is the Donner Lake belt; towards the south, the Inyo County belt; and the Shasta belt, about latitude 41°.

Velocipedism.

The *bicycle* is now thoroughly acclimatized, and an institution in our midst. The number of the vehicles of this kind in the city has grown beyond our counting—and from our exchnages we infer that the interior is also getting well supplied everywhere, as far as Salt Lake city. Manufacturers in this city have found the making of them to be quite a business. Every newspaper has an item on the subject. In the way of new inventions, there is little to report. It is held by many that the three wheeled velocipedes are too simple and easily worked to afford the diversion which makes the use of the two-wheeled ones so popular. We observe in the last number of the *Scientific American* an illustration of a steam velocipede, and also of a *one*-wheeled velocipede; but the genius that would ride the latter has not yet immortalized himself.

A velocipede excursion party to the Cliff House, a little while ago, was not a perfect success. The excursionists appeared in very high spirits while going out; but observing parties who returned from there at a late hour, reported them belated, out of spirits, dejected in appearance, and making slow progress towards the city. It is evident that amusement, not utility, is the strong point of the velocipede.

It now appears that there is a patent on the velocipede in this country, taken out by a shrewd Frenchman in 1866, though there is nothing of the kind in the old country. Several New York and Newark, N. J., firms, have suspended operations, having discovered on the patent records the following: "Patent No. 59,915, Pierre Lallament, Paris, France, assignor to himself and James Carroll of New Haven, Ct., Velocipede; Nov. 20, 1866. The fore wheel is axled in the jaws of a depending bar. This wheel is revolved by a treadle-crank. Claim: The combination and arrangement of the two wheels, provided with the treadles and the guiding arms, so as to operate substantially as and for the purpose herein set forth. This patent is claimed by a Mr. Calvin Witty, of New York.

The Gas Engine or "Moteur Lenoir," imported from Paris by Mr. Derbec, and now driving the press of the French *Courier* of this city, has justly won great favor amongst those who went to the *Courier* office to witness its operation. It is so simple, and cheap, costing $250 plus 30 per cent duty and transportation, and furnishing half a horse-power French, equal to several horse-power English computation, and can be used in any parlor where there is gas, at 15 cents an hour, without delay as in getting up steam—that in all probability it will soon come into extensive use; and in view of the interest taken in the matter we will endeavor to furnish our readers a fuller account of the points relative to it and an illustration of the machine in a future number. The *Herald* reporter says of it:

"The gas engine resembles in every respect a steam engine, only the cylinder is a little larger, and there are two valves instead of one. Through one of the valves a mixture of ninety per cent. of air and ten of our common gas is introduced in the cylinder. This mixture is ignited at both ends of the cylinder by an electric spark. A part of the oxygen of the air consumes the carbon of the gas which produces carbonic acid, and hydrogen. The whole of this gasiform matter, like steam, forms a pressure on the piston, which sets the machine in motion. The other valve is intended to let off the residue of the consumed matter. A one-horse power gas engine consumes about forty feet of gas per hour."

The California Medical Gazette for March contains a continuation of Dr. Stout's paper on Hygiene and Seworage in San Francisco; do. of Dr. John Scott's paper on Uterine Displacements; editorials on small pox, etc.; and a report of the meeting of the California Medical Society, besides a number of selected articles of importance to the medical profession.

The Locher Steam Plow.—We have received the following from one who was present at the recent public trial, at Oroville, of Locher's steam-plow—of which we will furnish an illustration and full description in the Press in due time:

Editors Press:—It is with pleasure that I give an account of the successful trial of Locher's steam plow.

The farmers in this vicinity are highly elated with the result, as also several gentlemen from your city and from Solano county.

The plow was started at ten o'clock, and plowed up the field at the rate of three acres per hour, cutting eight inches deep; there were some stumps and large boulders in the field, which retarded the speed of the plow some. During the day the plows came in contact with a stump, and a few of the points broken; but it could scarcely be noticed in the work they performed. The farmers express themselves freely, that it is impossible to put the soil in as good condition with a gang-plow and harrow, as this plow leaves it at one operation.

The machine is mounted on six wheels, which are all driven by the engines, by means of gearing, so in turning a curve each wheel adopts the speed the curve requires; this is accomplished by the application of equalizing gears. On a straight track the six wheels have the same speed. The boiler rests on the front and middle wheels, in the rear of which there are a pair of ten-inch engines, which drive the wagon and plow by means of gearing. The thirty-nine ploughs are on a transverse shaft, in the rear of the machine, and cut a swath of twelve feet wide; the shape of the plows is such as to turn and pulverize the soil.

A Farmer.

Oroville, March 2d, 1869.

The New Light.—The "bourbouze" light, produced by throwing upon a pencil of magnesia equal parts of common street gas and oxygen, "literally,"—says the *Scientific American*,—"throws all other lights in the shade. We tried it with a sheet of white paper corrugated, and inclined so that portions should be thrown into shadow, thus magnifying any motion that might be imperceptible to the unaided eye, but could not detect any motion whatever. So brilliant and pure is this light, that the ordinary gaslights look like spots of sickly and ghastly yellow when placed between the eye and the pure white illumination of the bourbouze burners."

Professor Doremus, at a recent lecture at Steinway Hall, New York, described this light, and the manner of preparing the oxygen by passing superheated steam over manganate of soda. Among the advantages claimed for the light are the saving of 30 per cent. of cost, and the diminished effect in deteriorating the air of the metropolis,—since it does not, as is the case with common gas, rob it of its oxygen.

Officers Elect of the Mechanics' Institute.—The result of the annual election held on Monday last, is as follows: President, A. S. Hallidie; Vice-President, J. R. Wilcox; Treasurer, H. L. Davis; Corresponding Secretary, J. H. Gillmore; Recording Secretary, George Pardy; Directors, William C. Pease, John Hancock, D. R. Coleman, Jacob Browning; George C. Hickox, H. P. Herrick and H. C. Macy. For directors there were two opposition tickets, besides the regular one; the successful one being one of the opposition. The successful ticket comprises many of the old officers, who have been well tried and were popular. The President and several others were reelected by a unanimous vote, the total number cast being 254. Mr. Cherry, Chairman of the Committee on Election, installed the new officers on Thursday evening, giving them an excellent address. The annual address of the President was well received.

Public Conveyances, Etc.—The weekly and monthly tabular publications interesting to business men, travelers, freighters, etc., of the *Commercial Record*, F. R. Voight, publishers No. 33 New Merchant's Exchange, are received regularly, and are found always up to date, and of great convenience to everybody.

Committee on Earthquake Topics.—At the meeting of this committee, on Thursday evening last, it was "Resolved that the Secretary be directed to notify each member of 'the Joint Committee,' by the insertion of a copy of this resolution in each notice calling the next meeting, to be held on Thursday evening next, that the reports of the Secretaries and some of the sub-committees will be read at that meeting, showing the present condition of the inquiry, and that it will then be proposed that the Joint Committee do adjourn until such time as all the sub-committees will be ready to make their final report. For the above objects the attendance of every member of the committee is particularly requested.

Excellent Paper Again.—We have now received a large stock of superior printing paper for the Press, shipped direct from the East for ourselves. For the past few weeks we have had to buy our paper here, and although we secured the best newspaper stock afforded in this market, it was very unsatisfactory, compared with our usual quality.

The Islands of Pyramid Lake at this season are thickly covered with the eggs of gulls, ducks, pelicans, and other aquatic fowl, that have crossed the Sierra. The Indians never visit them, on account of some local superstition.

L. Carpenter.—The Postmaster at Benton Harbor, Michigan, says the copy of this paper, sent [by some individual] to the above name, is not taken out.

Returned.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. Taylor, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

O. M. Taylor, who acted as agent—*for a very short time*—for this paper in the State of Nevada, last August, is requested to call at this office and attend to business matters on that account.

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v18-3im

Where to Advertise.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low 10v17tf

(From the new "Dominion.)

At this season, when coughs and colds are so prevalent, an effectual remedy, and one easily obtained, is Perry Davis' Vegetable Pain Killer. It is no new nostrum, vended by unknown agents, but has stood the test of over twenty years, and those who use the article, internally or externally, will connect with it grateful recollections of its worthy inventor.—*Hastings' Chronicle, C. W.*

Pain Killer.—The testimonials borne to the efficacy of this valuable medicine are sufficient to warrant its introduction in every house. Our own opinion is that no family should be without a bottle of it for a single hour. In flesh wounds, aches, pains, sores, etc., it is the most effectual remedy we know of. A bottle will last for a very long time, and its low price places it within the reach of all.—*St John News.*

☞We are glad to learn that the "Pain Killer" is having so large a sale in our city. We have every reason to believe it to be an almost never-failing cure for pain, and a medicine that no family should be without.—*Montreal Pilot.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

KERRIGTON & CO., and HOSTETTER & SMITH, San Francisco Cal., General Wholesale Agents. mlm

J. S. PHILLIPS, M. E.,
CONSULTING ENGINEER,
Examiner of Mines, etc.,
423 Washington street.....San Francisco.
(Having had 33 years' experience in Europe and America,) supplies drawings and designs for Pumping, Hoisting, Crushing, Separating, Roasting, Chlorinizing, Milling, Lixiviating, Precipitating, and Smelting Works. Minerals analyzed, and advice given for beneficial treatment. Lessons on the Discrimination and Assay of Minerals by Blowpipe, Chemicals, Scorifier and Crucible. 4v17tf

FOUNDRY FACINGS.
BENJAMIN ELLIOT,
No. 483 Brannan street.....San Francisco,
Manufactures Foundry Facings constantly, from choice coals (Bituminous Anthracite, and Charcoal, packed in tight sacks,) ground together or separate, packed in whole or half barrels. Black Lead, Coke and Soapstone ground to order. Foundrymen located far from choice material, can rely on having superior Facings forwarded to order.
10v18qr

Offices to Let.
Two convenient front rooms (No. 9 and 10) in second story of No. 423 Washington street, to let on favorable terms. Apply at this office, up stairs. No. 414 Clay street.

Valuable and Popular Practical Books.

Painter, Gilder, and Varnisher's Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Varnishing, and Glass Staining, with numerous Useful and Valuable Receipts; Tests for the Detection of Adulterations in Oils and Colors, and a statement of the Diseases and Accidents to which Painters, Gilders, and Varnishers are particularly liable, with the simplest methods of Prevention and Remedy, with directions for Graining, Marbling, Sign Writing, and Gilding on Glass. To which are added Complete Instructions for Painting and Varnishing. 12mo, cloth.....$1 50

The Practical Brass and Iron Founder's Guide.—A Concise Treatise on Brass Founding, Molding, the Metals and their Alloys, etc.; to which are added recent improvements in the Manufacture of Iron, Steel by the Bessemer process, etc. By James Larkin, late conductor of the Brass Foundry Department in Reany, Neafie & Co's Penn Works, Philadelphia. Fifth edition, revised, with extensive additions. In one volume, 12mo..... 2 25

A New and Complete Treatise on the Arts of Tanning, Currying, and Leather Dressing.—Comprising all the Discoveries and Improvements made in France, Great Britain, and the United States. Edited from Notes and Documents of Messrs. Salleron, Grouvelle, Duval, Bessables, Labarraque, Payen, Bene, De Fontenelle, Malapeyre, etc. By Prof. H. Dussance, Chemist. Illustrated by 212 wood engravings, 8vo..... 10 00

The Miller's, Millwright's and Engineer's Guide.—By Henry Pallett. Illustrated. In 1 vol. 12mo..... 3 00

American Miller and Millwright's Assistant. By Wm. Carter Hughes. A new edition. In one volume, 12mo..... 1 50

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address.

Crucibles.
The Patent Plumbago Crucible Co.,
Manufacturers of all kinds of
Melting Pots, Portable Furnaces,
CRUCIBLES, and other fire-standing Goods,
[Battersea Works, London.
THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pourings.
On hand and for sale by the Agents,
A. S. HALLIDIE & CO.,
1v18 3m9p 519 Front street, San Francisco

$20,000 to $25,000.
A PRACTICAL SMELTER wishes to enlist capital to build a Furnace on a Mine of rich Argentiferous Galena at White Pine. From $300 to $1,000 a day can be cleared with ease. Security and best of references, etc., given.
Address, WM. F. HILTON,
7v18-1m9p San Francisco P. O.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continuat working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hunsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

From the Mount Diablo Coal Mines.

EDITORS PRESS:—On a visit to the coal mining region of Mount Diablo, the first place reached after leaving Antioch, on the San Joaquin, is Somerville, a mining town situated 760 feet above the sea. Here are three very large mines, which are worked, however, only ten hours out of the twenty-four. Nearest to Antioch is the Pittsburgh mine, of which Mr. C. E. Clark is the Superintendent. The discoverer of the vein was a brother of the present superintendent, and died three months ago. I was kindly piloted through the Pittsburgh mine, and found fifty men employed in getting out coal. We went down 300 feet on an incline and struck the Clark vein, which is three feet thick; then went up in the cars for 200 feet and struck another vein, the Black Diamond, which was first discovered by H. S. Hawxhurst, in digging a well six miles from this place. The shaft is down 500 feet. Coal is brought out of a tolerable quality at the rate of 2,000 tons per month. It is immediately dumped into the railroad cars and run down the grade without engines, to Pittsburgh landing, and there dumped into flat boats for different destinations. The railroad is owned by another company, which carries all the coal for the Pittsburgh, Union and Eureka mines.

The next mine is the Independence, 200 feet below the Pittsburgh. This mine is at present standing still, but I am told that it will be running again in three or four months. It is 700 feet deep, and has produced quantities of very good coal; but the water in the mine is so acid that the iron pipes, boilers, etc., for pumping, were eaten through in a day's time, and it seems that the company cannot get the water up through metal pipes. I am told that at places where the water dropped on the pipe, holes were eaten through the latter in the course of the very first day the pipe was placed there. A few drops, the miners say, will go through thin pipe in twenty minutes. For use in the boilers, good enough water could be obtained from the other mines situated above this.

The Eureka mine is about 300 feet from the Pittsburgh, and is in active operation under the superintendency of Mr. R. Wingate. The shaft is down 600 feet. Number of men employed, fifty-five. There are two engines in the mine, one for pumping water and the other for hoisting to the first level. Steam is carried to the engines by means of 2-inch, covered pipes. A good deal of bad air has been experienced in this mine, but a ventilation shaft was opened, and boxes were constructed to carry it out, since which there has been no difficulty. Product, 2,000 tons per month. In this, and in all the other mines, the men are paid by the yard; here the price is $1 per running yard, the vein being three feet thick.

The Union mine is a quarter of a mile from the Eureka, and employs sixty men. The Superintendent is Mr. George Hawxhurst, brother of the discoverer of the Black Diamond vein. There are two engines in the mine, one for pumping, and the other for hoisting to the upper level. They are down 600 feet.

The Manhattan is a small mine between the Union and Enreka; it is standing still at present.

We now leave Somerville and cross a ridge west of the town, to Nortonville, 1½ miles distant,—the locality of the Black Diamond Company's three mines—owned by the California Steam Navigation Company—a sooty black spot, showing much activity. These mines turn out 6,000 to 7,000 tons of coal per month, and could turn out 11,000 if there were a demand for that amount. As the coal, when exposed to the atmosphere for more than a month or two, is liable to ignite, the aim of the company is to take out just what they can sell for the season, thereby avoiding loss. Large piles of self-ignited "slack" may be seen burning night and day at the mouths of the mines.

The number of men employed by the company is 325, and the wages are $1 per yard. A man will get out from two to six yards per day.

Not only does the Steam Navigation Company own these mines and the railroad

leading from them to New York landing, about six miles distant, but they have made arrangements with the Pittsburgh, Eureka and Union mines, to take 500 tons of coal per month from each of them for five years to come; thus gaining the control of the market.

Two very large engines are used in the Black Diamond mines, one for hoisting and the other for pumping. Both the Clark and the Black Diamond veins are well developed here,—the latter furnishing the best coal in the district. The veins seem to be broken in a good many places.

Both at Nortonville and at Somerville the veins dip to the northward, varying in different places with the coal measures, from 26° to 38°. The country rock is sandstone of Cretaceous age, which is immediately overlaid by strata taken by Whitney to be of the Eocene Tertiary formation.

W. H. M.

A Private Word About White Pine.

EDITORS PRESS:—As an offset to some of the flourishing letters from White Pine, which constantly appear in the papers, I send you an extract from a private letter received from a man who went from here about two months ago, and who is personally known to me. The letter is dated Silver Springs, February 3d. He says:

"This country is one grand swindle, and overybody is *on it* as big as a skinned horse. As for myself, I can't make up my mind that I can swindle anybody, therefore I appear perfectly helpless. * * * Think you did well to stick to Lone Pine. You will spend a much more pleasant winter than I, for I can assure you it is as cold as," (it is supposed the writer meant, as Heaven); "still we have had a very moderate winter for this country; the snow lies now about a foot in depth, but yet it don't seem to stop the travel. Every stage comes loaded. To tell you the fact, I think they are coming to be humbugged. Yet those who go into "business" will make money, but a man can do nothing here without three or four thousand dollars. I have been told by two different persons, that they would furnish everything for me to start business, if I could get a house; but I can't get one for any price, without it is in some out of the way locality. * * * Keep me a stall in the stable to sleep in next summer, as I will be there as sure as I live. It costs $5 a day to keep a horse here."

The writer certainly gives only one side of the picture, but it is *the* side which many who go there will have to encounter. His letter has diminished the intensity of the fever hereabouts. C. H. AARON.

Lone Pine, February 21st, 1869.

MINING VS. AGRICULTURAL CLAIMS.—The Register and Receiver of the Sacramento Land Office, on the 18th inst., decided in favor of the Treasury mine, as against agricultural claims. This mine is situated about half a mile above the Eureka mine. The Eurekita and the Branch Mint claims, situated in the same neighborhood, were decided to be mining and not agricultural lands a few weeks ago.—*Grass Valley Union, Feb.* 21.

STORM TELEGRAPHING.—It has been ascertained that the storms which visit France come from the Atlantic, with a single exception, viz., that of local storms engendered by the winds of the Mediterranean when they skim the declivities of the south-eastern coast. It has, however, occasionally been observed that when the clouds proceeding from the sea have covered the sky in the maritime departments, thunder and lightning are observed in the inland ones.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Railroad Items.

MR. BANNING, the Superintendent of the Wilmington and Los Angeles Railroad, says he will have that road completed and the cars running by the 1st of July.

JULIUS A. SKILTON, represeuting an American company, has received the concession to build a railroad from Paso del Norte, Mexico, to Guaymas, or some other point on the Gulf of California.

THE *Bulletin's* City of Mexico correspondent says a railroad will be built from Zacatecas to la Villa de Guadalupe, and J. M. Ramos has been already appointed engineer to make the necessary surveys.

THE Vallejo *Chronicle* mentions n rumor to the effect that the California Pacific Co. have purchased the Napa Railroad, which is to be at once extended from Calistoga to Healdsburg, and completed during the present season.

A WELL known citizen of Storey county, says the *Enterprise*, has gone to Washington to secure a land grant from Congress to aid the construction of a railroad from Elko, on the Central Pacific, via. White Pine, to Callville, on the Colorado, at or near which point it is intended to intersect the Southern Pacific.

THE ship Edith, from New York, laden with stock for the Central Pacific Railroad, and lying at Vallejo street wharf, on Feb. 25th unloaded six locomotives, named "White Eagle," "Roller," "Herron," "Eagle," "Jupiter," and "Rambler," all complete and in good condition.

BY June or July the Santa Cruz and Salinas Railroad—says the *Sentinel* of Feb. 27th—will he surveyed, located, and the compauy duly incorporated. The alignment survey and working plans will he made and grading commenced soon after. The parties interested in the road are said to have ample means to complete the work.

From Colima we learn that Mr. Gibbs, one of the directors of the Vera Cruz and Mexico Railroad Company, has arrived from England, and it is hoped that the work on the line will be taken up with more energy. The line from Mexico to San Augustine de las Cucoas is finished, and an American company has received the concession to build a railroad from the Rio Grande, near El Presidio del Paso, to Guaymas, or some adjacent point.

THE late snow storms in the Sierra have been unusually severe. The snow hetween Coburn's and Alta, a distance of fifty miles, was from five to fifteen feet deep, and at one gorge the snow plow was pushed by four locomotives, and they heing insufficient, their number was increased to nine, which were used for about three miles to burst through the drifts. The trains were five days getting through from Coburn's to Sacramento.

THE *Mountaineer* is informed by a letter from Boise City, that Col. Hudnutt, chief engineer of the Idaho and Oregon branch railroad, says that the road will most prohably pass up the Malhuer river, cross the Blue Mountains through the lower pass at the head of John Day river, and continue down on this side of the mountains through the rich and fertile valley of the John Day river to Dalles City, aud thence down the Columbia.

THE Peruvian railway lines in progress, viz., hetween Arequipa and Mejia and the one from Lima to Huacho, are being actively proceeded with. The line that is to connect the Capital, Janja, and eventually Cerro de Pasco, appears also to be seriously thought of, say the south coast correspondeuts, and not to remain a mere project as et first supposed. Mr. Joseph Hindle, an eminent English engiueer, has set out for Janja to make a final survey, and on his returu it is reported active operations are at once to commence.

COL. HUDNUTT, the locating engineer of the Union Pacific Railroad, is now nbout at Farewell Bend of Snake river, marching steadily on with a corps of eighteen engineers and four supply wagons, and making a very thorough survey and examinatiou of the route. If a grant of land is given this company, and uo extraordinary money crisis arrives before spring opeus, it is expected that this hranch railroad will he put under contract from the north end of Salt Lake to some point on the Columbia river, early next spring. At the rate of speed that has been obtaiued in construction, the road will be in running order to the Columhia river by July, 1870.—*Portland Oregonian, Feb. 15th.*

THE hreaking of the dam on the outlet of Clear Lake, has lowered the water in that lake eighteen feet.

Engineering.

OPERATIONS AT LIVERMORE PASS.—A correspondent who recently traveled through Livermore Pass and witnessed the railroad operations in progress there, states that powder is being used at the rate of 1,200 kegs per month, and that a considerable force of white men and Chinamen has been employed, which is to be increased in the spring to 1,500 men. Instead of going through the pass along its lowest practicable route, the road skirts the spurs and ravines high up on one side of the pass at a heavy cost for construction, then crosses the pass near its highest point by a great trestle hridge, and strikes through the mountain on the opposite side by a tunnel 900 feet long. Ahout six miles beyond the Mountain House, or thirty miles from Hayward's, the country becomes perfectly level, and continues so to Stockton and Sacramento.

BRIDGING NAVIGABLE RIVERS. — The steamboat interests on the Mississippi and Missouri river have sent a delegation to Washington to procure the passage by Congress of a law compelling railroad compauies to construct bridges hereafter to be huilt over the navigahle Western waters, with one unbroken span of at least 450 feet. It is the opinion of the Senate Committee that the long span will he approved by Congress, and that the hill of Mr. Drake, making it applicable to the Mississippi and Missouri rivers, will pass.

RECLAMATION OF TULE LANDS.—The tule lands, says the Stockton *Gazette*, can all, or nearly all, be reclaimed by cheap and simple eugineering, and when reclnimed will be found easily cultivated, and unsurpassed in productiveness. These lands can be reduced to cultivation at a cost not exceeding ten per cent. of the cost of reclaiming the sugar lands of Louisiana, or the rice lands of South Carolina; while their annual yield would greatly exceed the product of any other rice fields in the world.

GRADING AND PAVING.—The City Paving Company have the contract for grading, sewering and paving with the "Stow Fouudation" pavement, the extension of Montgomery street, from Market to Howard street. They will also lay asphaltum sidewalks about 15 feet wide. The new street will he ahout six feet wider than Montgomery street.

THE Cosumnes bridge, on the Western Pacific, will he a Howe truss, 600 feet long, and the trestle work immediately connected with it will be 800 feet long, while another piece of trestle work over a slough through which the waters of the Cosumnes run in flood time, will he ahout 300 feet long, thus making an opening for the waters of the river of 1,700 feet.

COST OF PILING FOR FOUNDATIONS.—One of the buildings on California street, near Sansome, which was badly injured hy the earthquake, is ahout to he replaced by a more suhstantial structure, which is heing huilt upon piles. The lot has a frontage of 100 feet by a depth of 89 feet, and the piling of it has cost $20,000.

CABLE BETWEEN CUBA AND SPAIN.—The Spanish Minister of Marine and the Colonies has invited tenders for the establishment and working of a submarine cable hetweeu the islands of Cuba and Porto Rico, the Canary Islands, and some point ou the Spanish coast.

TELEGRAPH MATERIAL.—We noticed upon the wharf of the O. S. N. Co.'s wharf, yesterday, a large lot of telegraph wire which the Company is about to ship up the Columhia to he used in the construction of the Portland and Boise line.—*Portland Oregonian, Feb. 20th.*

MISSION rock is being graded off to a safe point above high-water mark, in order to adapt it for the ways and docking apparatus now at the foot of Second street, helonging to H. B. Tichenor.

THE sea wall has been extended nearly to Market street, and a dredging mnchine is at work north of Market street removing mud from the proposed foundation.

THE frame of the hridge to he huilt over the river at Marysville, will he made at South Vallejo.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

White Pine Items.

Some very able correspondeuts have got to White Pine, and are contributing letters to the leading journals; every newspaper in the State having·its special correspondent, present or prospective, from Eastern Nevada. "Chloride," in the Virginia *Enterprise*, writes a series of letters, telling in an entertaining manner the story of the discoveries that were made up to last Fall, and the manner in which title to the rich deposits has become tangled up at law.

It is saddeuing—at our distance—to read the following account of one who recently went over 65 miles of the White Pine road: "The weather was intensely cold, the snow deep, and the entire country a bleak, timberless waste, with only here and there a black rocky peak piercing the surrounding banks and peaks of snow. The thermometer was below zero every day. The stations are exceedingly primitive, nothing but light tents for shelter to man or beast. On the road were crowds of men, struggling along on foot in the direction of the frozen El Dorado. The stages cannot afford transportation for all. At some points we encountered men making their way alone through the wilderness, carrying only a single blanket and a few ounces of provisions."

The thermometer has been ranging many degrees below zero, down to 16°, says the *Bulletin* correspondent of Feb. 23d, at Treasure City, and the snow falling thick and fast is tumbled by the fierce wind into heaps and driveu through the chinks of the ill-constructed habitations with a freedom that leaves its distribution pretty even in-doors and out. Cases of pneumouia, congestion of the lungs, erysipelas, etc., are still common, many of them proving very severe and fatal. Two hospitals are located at Shermantown—one a private and the other a public establishment. Into the latter persons in needy circumstances are admitted without charge, a fund having been raised by citizens for defraying its expenses.

The tide of immigration from the East has already set in. From ten to fifteen and twenty men were passing Ruby Station daily.

Results thus far at White Pine are summed up as follows: Four quartz mills have been completed, and several others gotten under way; three smelting works have been put up; nearly twenty miles of mountain wagon road, some of it very difficult and expensive, have been graded; and work, in a few cases very costly, and in all of greater or less magnitude, bas been done on about a thousand mines.

Though miuing and prospecting are only exceptionably possible, by reason of the extreme cold and snow, the business of forming corporations in this city is, if anything, increasing.

American Rifles.—The only repeating rifles uow made in this country are the Winchester, at Bridgeport, and the Spencer at Boston. The former is an improvement on the celebrated Henry rifle, carrying eighteen shots, and can be fired with great rapidity. The latter is a seven-shooter, and in Sherman's campaign through Georgia six men on a picket post armed with the Spencer carbine kept at bay some time a whole battalion of the enemy by the rapidity of their firing. These repeating rifles are used for hunting on the plains, and meet with much favor in foreign countries. American gun makers regard the famous Prussian needle gun as inferior in every respect to our best patterns.

Eighty Oxen Cooked per Hour.—The largest kitchen in the world is that of Liebig's Extract of Meat Company's establishment at Fray Bentos, on the river Uruguay, South America. The building covers an area of 20,000 square feet. In one hall there are four meat-cutters, which can dispose of 200 bullocks each per hour. There are 12 digesters, in which the meat is boiled by steam. They can hold altogether 144,000 pounds of beef. About 80 oxen per hour are actually slaughtered for this immense establishment.

Onions as Weather Prophets.—In Southern France farmers prognosticate the probable temperature of the season in getting in their crop of onions. If the weather is to be mild, they say the skins are thin, if severe, extremely strong and tough.

Births and Deaths.—A man, womau or child dies every second. Of births, rather more than one per second occurs. So the world's population increases.

A Hint.—Ground chicory sinks—Ground coffee floats.

Resources and Developments.

Among the resonrces of Los Angeles county is hydranlic lime or cement, of good quality.

The Los Angeles Canal and Reservation Company have 100 men at work, and expect to have their work completed in a short time.

The demand for public lands in Colusa county continues brisk at the land office in Marysville, and from 15,000 to 20,000 acres have been sold the past week or two at $1 25 per acre, currency.

Cork Tree.—The Tulare *Times* says: Mr. J. N. Thomas has a cork tree growing in his front yard, about three inches in diameter and twelve feet high, which grew from the seed, planted about seven years since.

The Stockton *Gazette* says A. O. Thomas and James R. White are fitting up a number of warehouses at the head of steam navigation on tbo San Joaquin, or rather on Fresno Slough, eight miles from tbo river. It is an important freighting point, and is in a rich sectiou of country.

St. George, in Southern Utah, has in operation eight sawmills, two shingle machines, ten flouring mills, two carding machines, and an extensivo cottou factery, owned by Brigham Young. Tbe principal product is raw cotten, for the successful cultivation of which the mission was established.

A Montana hunting party, consisting of six men, who went out for profit not sport, and remained in ono camp, a few miles below Kennedy's on the Missouri, since winter set in, have closed their operations for the season, having killed and sent to market 170 deer, 20 antelope, 91 mountain sheep, 16 elk, 4 gray bears, 2 panthers, and 11 lynx, which netted the party, from sales in the Helena market alone, upwards of $3,000 in gold.

Whaling Stations on the Northwest Coast.—Mr. Dawson intends establishing a whaling station on Cortez Island, in the vicinity of which be anticipates a good catch during the coming season. Another whaling expedition, under Capt. Roys, is preparing to start for Barclay Sound shortly. The schooner "Kate" arrived at Victoria from the Gulf of Georgia, with 2,400 gallons of whale oil, on Feb. 23d.

Semi-Tropical and Nut Trees.—In Los Angeles Co., says the *Star* of Feb. 20th, the purchasing and planting of trees is now very general. There is scarcely a wagon leaves town but carries with it a lot of fruit trees for planting. The prevailing kiuds are the semi-tropical, with the walnut and the more hardy and common fruits. On the "Brent place" at Los Angeles, Gen. H. B. Davidson has planted 250 walnut, 1000 orange; and 1000 lemon trees. Its value has tripled within a year.

Alaska Seals.—Joseph Krewskewsky and other natives of Alaska, stated before a committee of the Chamber of Commerce this week, that the number of seal that flock to St. Paul's Island each year is estimated at 3,000,000, while 1,000,000 visit St. George's. One of the witnesses thought that 150,000 could be taken annually; but another thought that to kill over 100,000 would destroy the trade and drive them away. One witness estimated the numbers taken last year at 202,000. The proper time for killing is abont the 25th of May, but they state that Hutchinson, Kohl & Co. commeuced killing in the latter part of March, and took at least 160,000 skins, of which they now bave about 100,000 on hand.

Solano County Quicksilver.—We have just been shown specimens of cinnabar taken from the mine owued by Mr. John Brownlie, near this city, which for richness equals anything to be found in the celebrated Almaden mino. The extent of the lead is not yet known, but Mr. Brownlie is sanguine of having struck a good thing, without having to go to White Pine.—*Vallejo Recorder, March 2d.*

Sale of Vallejo White Sulphur Springs.—It is currently reported on the streets, says the Vallejo *Recorder*, that Mr. Connolly bas sold the White Sulphur Springs near this city, for the round sum of $25,000, and that the purchasers intend to conduct the sulpbur waters of the spring to this city.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Writers should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

IMPROVED INNER SOLES
—FOR—
BOOTS AND SHOES.

Those who have worn Daggett's Patent Elastic Ventilating Inner Soles, are unanimous in testimony that the correct principle has been hit upon and reduced to practical and successful use. The foot rests upon a cushion of air cells between points of vulcanized rubber, every cell opening freely into each other and through the space occupied by the foot. There is no contact of the foot with the wet bottom of the boot. The elastic points sustain the weight of the wearer, leaving an air space always, between the foot and all dampness. Every step compresses and restores the air chambers, thus constituting hundreds of air pumps, working at every step of the foot.

The rubber points will not absorb the moisture from the boot, so that the soft flannel which covers them is always dry. Their springing elasticity renders them of peculiar value to the aged and infirm, who feel the jar of walking upon hard substances, also to all persons whose business requires much walking or standing.

These soles are affording great relief to persons afflicted with rheumatism and consumptive complaints, chilblains, corns, cold and sweaty feet.

For warm and dry feet use the Patent Elastic Ventilating Inner Soles.

No. 15 Exchange Street, Boston, Oct. 15, 1867:—This may certify that I have used the Patent Elastic Ventilating Inner Soles, through the spring and summer past, and have found them to be the best contrivance for keeping the feet dry and comfortable, that I have ever used, and for any one having corns or tender feet, the best article over invented. CHARLES K. DARLING, Stationer.

Patent Elastic Ventilating Soles.—If you wish a comfortable article for your feet, a real luxury in cold weather, obtain a pair of the Patent Elastic Ventilating Inner Soles. Having used these soles the past winter, we can safely recommend them as tending not only to promote the comfort of the feet, and ease in walking, but also the equalization of the temperature of the feet, which renders them almost invaluable.—[Boston Traveler, Oct. 1867.

Price, per pair, **$1**. By mail, postage paid, **$1.25**. For sale by PATRICK KELLY, No. 327 Bush street, San Francisco. 3v1eff

New Mining Advertisements.

Cordillera Gold and Silver Mining Company.—Chihuahua, Mexico.

Chloride Mountain Tunnel and Mining Company.—Location of Works: White Pine Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of February, 1869, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 615 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the tenth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAMES RICE, Secretary.

Office, No. 615 Kearny street, San Francisco. feb13

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1869, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 426 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth (5th) day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth (30th) day of March, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N VAN BRUNT, Secretary.

Office 426 Montgomery street, San Francisco. jan30

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until the second day of April, 1869, and the sale thereof until Tuesday, the twenty-seventh day of April, 1869. By order of the Board of Trustees.

mar6 R. N. VAN BRUNT, Secretary.

North American Wood Preserving Company.

Location of Works: San Francisco, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifteenth day of January, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John L Samuels	not issued	800	$800 00
George W Dent	1	400	400 00
Henry S Dent	not issued	200	200 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of January, 1869, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 430 Montgomery street, San Francisco, Cal., on Monday, the eighth day of March, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of said sale.

WM. B. LAKE, Secretary.

Office, 430 Montgomery street, San Francisco. feb20

Star Creek Mining Company.—Location: Star District, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of February, 1869, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of March, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the nineteenth day of April, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HORACE MORRISON, Secretary.

Office, N. E. cor. Front and Jackson streets.

MECHANICAL AND ARCHITECTURAL
Drawing School
—FOR—
APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. 414 CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

1v18.tf

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint

—FOR—

TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

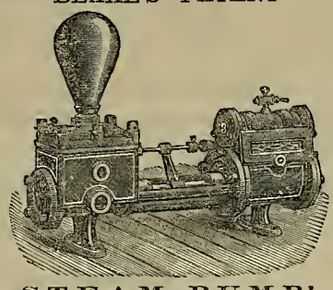
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust looseued by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco. Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer wash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

Novelty and Usefulness Combined.
Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only

GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other imitations by which their right may be infringed.

Caution against Fraud.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-1y

Our Patent Agency.

THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

[Written for the Mining and Scientific Press.

Idaho Correspondence.

YUBA.

EDITORS PRESS:—Mr. Matthew Graham, the original vendor of the mines owned by the Lucy Phillips Gold and Silver Mining Company, has lately struck the Atlanta lode on the 5th easterly extension—east of Montezuma Gulch, and about 1½ miles easterly from where the Monarch Company have been taking out the rich ore,—referred to in the PRESS a few weeks since,—the same streak or vein is found, thus showing that the Atlanta is a lode for at least 1½ miles. This will cause intervening owners to renew their exertions to develop this extraordinary lode, which, without any other ledge, is enough to build a town there; but the owners of the Varieties are also developing a lode very rich in gold. The Minerva Company have their tunnel in nearly 200 feet, and find a valuable vein, and other lodes referred to, all sufficient to satisfy any one but such as are not willing to be conviuced, that the prophecy heretofore made, that in three years Yuba will rival Owyhee, will ere long be a fixed fact.

Although a good many are leaving here for White Pine, yet they almost invariably say, they will go and see that place and return here after a time. Few, if any of those who "weathered" the first hard times of this country but have a firm faith in it that cannot be shaken by any White Pine or Grant districts.

BOISE VALLEY.

Farmers are plowing and sowing, and the feeling is that large crops must be put in the grouud; but little fear is felt of grasshoppers (the pest of two years past) as the eggs left here last year are, from examination, generally supposed to be barren..

SNOW AND PLACER MINING.

The snow that has fallen in the monntain districts is very hard, being well packed, and the recent heavy storms have so far added to the earlier well-packed snow, that the miners are looking forward to a very favorable season for placer mining, and those of Boise Basin are therefore in correspondingly good spirits.

The Granite Bar claims, on Boise River, ten miles above this city, will be in operation in a few days, and we shall soon learn if Ada is to come into the circle of placer mining counties.

VELOCIPEDES.

Our enterprising blacksmiths, Maupin and Carlton, have made two velocipedes, the first with two, and the second one with three wheels, but few, if any here, understand the former. They can not be made at less than from $60 to $100 each, in gold.

TRUTHS ABOUT THE TRADE OF THE INTERIOR.

Whilst the Californians are striving for the trade of the interior, let them hear a few wholsome truths. Before July, merchandize can be brought here from Chicago, or even New York, for about $53.75 per ton weight, in very little more time than from San Francisco. Our merchants can buy cheaper East, of everything, except East Indian and China produce, and can get a reasonable time on the goods. San Francisco time has always been sixty, and never over ninety days, without interest, and after that time, as high rates as the law would allow, and the Ocean and River Steam monopolies have made freights come to be pretty near—as our Teutonic friend at Colville, W. T., said, (in 1859) when, in demanding twenty five cents for a needle, the purchaser (a French Canadian) inquired: "Why, what makes a needle so dear?" "It is not the firsht cosht," replied the Teuton, "dat is noting, it is the cash monish for the freights—dat ish h—ll."

INDIAN DEPARTMENT CONTRACTS.

To-day, some contracts for the Indian Department were let, amongst them, 860,000 as freight from here to Fort Hall, about 250 miles, at $97.80 per ton—in Legal Tender Notes—to Mr. Hardy, and as he will load back either with the Oneida salt, or else go to the R. R. for a load, it will pay him well.

WINTER ROADS AND INTERIOR COMMUNICATION.

The roads are all good east of us, whilst westward are the Sierras on the California route, and the Blue Mountains on the Co-

lumbia River route, but the latter have been open all winter, (for six winters past) with one short exception only, whilst the Sierras get blocked, even in spite of snow sheds, etc. If California wants to keep the trade of the interior, they must offer far greater inducements to the merchants of Washington, Idaho, and Montana, than they have ever yet done. "A word in time to the wise." PEGASUS.

Boise City, I. T., Feb. 23d, 1869.

HOW WHITE PINE INCORPORATIONS ARE FORMED.—Many of our readers, perhaps, have wondered how and by what means the public were so frequently and thoroughly "bilked," to use a familiar term, into patronizing "wild-cat" schemes during every mining excitement. "Being once bit the bitten turns upon the biter," is an old saying, which in this case at least seems to fail; but like the swine spoken of in holy writ he returns to his wallow to be again sacrificed by the speculator. The Treasure City correspondent of the Austin *Reveille* gives us a slight insight into the *modus operandi* as follows:

We are informed that the Knox Tunnel Co. has been incorporated in San Francisco with a capital of not less than one million. This tunnel was located about ten days ago on the east side of the hill, and, so far, two days' work has been done on it. In fact the parties locating have selected a place where a tunnel can be run—then incorporated. It is a fact within my knowledge, that the notice of location of this tunnel was not recorded until yesterday, and that, after the parties heard that the same was incorporated. The speed of this claim, when compared with a land office business, would be like running a locomotive against a jackass. No doubt they will be taking out chloride next week, although the tunnel will have to be run 1,000 feet to strike it. This tunnel scheme is almost as good a joke as the location of the Slim Jim claim, and that is too good to be lost. We give it as it occurred.

The Slim Jim ledge, so called, is somewhere between this and the Eberhaadt and on the side of the hill. About one month ago a party of capitalists were coming up the hill; before them they noticed a man with a crooked stick in his hands walking back and forth like a soldier on his beat. Coming up to him they inquired what he was doing? He informed them with the utmost confidence that he had found the "old he" ledge. Then he twisted himself into a thousand shapes, walked back and forth, and showed them that when he came to a certain place, his rod would turn in his hands, thus indicating beyond all doubt that he had found the "old he one." Some of the others tried it, but owing to the want of faith or something else, it would not work in their hands. He said he was about to make the location. They told him they wanted a chance in it. After considerable negotiations, on learning who they were, he consented. They at once paid four bits apiece to have it recorded. When they got home, they commenced to form plans to get their money back. Their fertile brains invented the following plan: when a capitalist comes they call his attention to the claim, and inform him that so many feet can be had of a certain party. He bites; a few feet are sold for a small sum, as an accommodation. On this plan it has nearly all changed hands, and now some of it is held by some of the wealthiest men in the State of California, who, I suppose, think they have a big thing.

CALIFORNIA

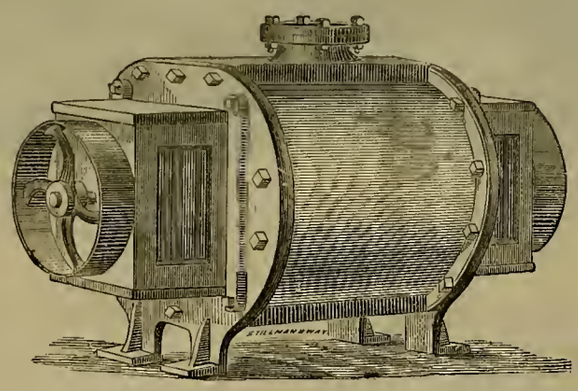
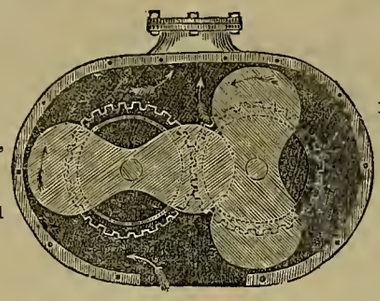
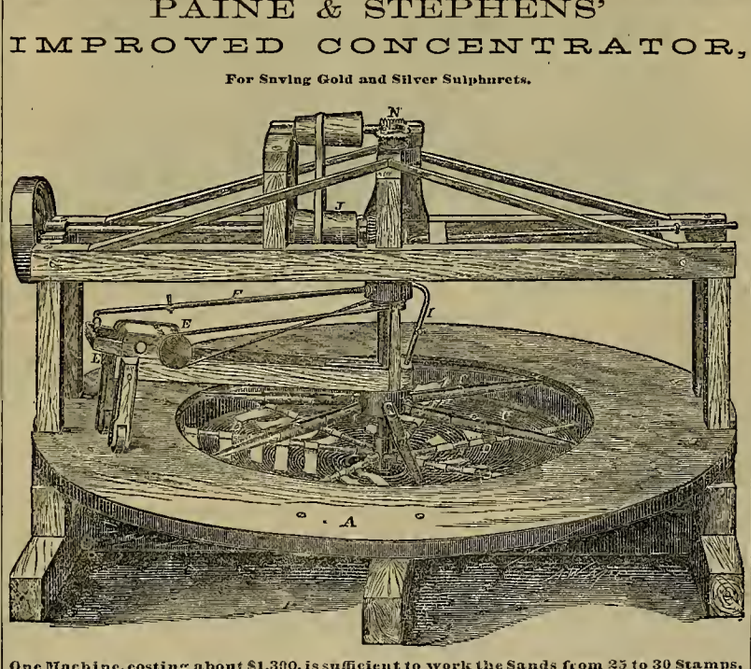
DEWEY & CO.,
American and Foreign Patent Agents,
Messrs. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, the only well-established successful Patent Agents west of the Rocky Mountains, give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its leading branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.
Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.
DEWEY & CO.,
Patent Agents, Publishers and Printers, 414 Clay street below Sansome, San Francisco.
A. T. DEWEY. W. H. EWER.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.


ADAPTED FOR Smelting, Foundry, Mining and Steamships.


REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.
For circulars and further information, address
KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.


One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,
Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.
CERTIFICATES:
GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.
This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.
NEVADA CITY, Oct. 26, 1868.
Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
14v15qr.

MEUSSDORFFER,
HAT MANUFACTURER
And dealer in
Hats and Caps
AT WHOLESALE AND RETAIL.
635 and 637 Commercial street.....San Francisco.
125 J street.....Sacramento.
Corner of D and second streets.....Marysville.
72 Front street.....Portland, Oregon.
Our wholesale House, 628 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m

New Incorporations.

Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

WHITE PINE REAL ESTATE, ROAD AND WATER CO.—White Pine, Nev., March 1st. Capital Stock, $1,000,000; 10,000 shares, $100 each. Trustees: J. M. McDonald, W. F. O'Neal, M. S. McDonald, Jno. Skae and David Fay.

OBISPO MINING CO.—White Pine, Nev., March 1st. Capital stock, $720,000; 7,200 shares, $100 each. Trustees, Thomas H. Holt, R. E. Brewster, Henry Critcher, Robert Apple and Samuel Heyneman.

SILVER COMET MINING AND TUNNELING CO.—White Pine, Nev., March 2d. Capital stock, $1,600,000; 16,000 shares, $100 each. Trustees: A. M. Heslep, Ira G. Hoitt, Wm. H. Taber and R. R. Rollins.

GEORGIA S. M. CO.—White Pine, Nev., March 3d. Capital stock, $1,440,000; 14,400 shares, $100 each. Trustees: Thomas Young, Joseph S. Paxson, E. Barry, W. Hollis, J. Bell, N. K. Masten and J. Palache.

TIDAL WAVE MINING CO.—White Pine, Nev., March 3d. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees, A. K. Grim, A. P. K. Harmon, C. S. Hobbs, W. E. Dean and J. B. Low.

BLACK HAWK S. M. CO.—White Pine, Nev. Capital stock, $500,000; 5,000 shares, $100 each. Trustees: A. S. Gould, H. F. Williams, W. H. Bryan, J. Tyson, J. W. McKenzie and Henry Epsiem.

GARDEN TRACT HOMESTEAD ASSOCIATION.—San Francisco, March 3d. Capital stock, $58,000; 168 shares, $350 each. Trustees: Jas. Graves, A. S. Gould, H. F. Williams, W. G. Doolittle, Chas. D. Wheat, F. B. Wilde and S. Littlefield.

ELECTION OF OFFICERS.—GOLDEN CHARIOT MINING CO. San Francisco, March 1st. President, J. D. Fry; Vice-President, Chas. E. McLane; Treasurer, Wells, Fargo & Co.; Superintendent, P. S. Buckmaster; Secretary, Joseph L. King; Trustees: J. D. Fry, G. W. Beaver, Thos. Cole, Jr., W. Ashburner, M. J. McDonald, Hill Beachy and Chas. E. McLane.

CALIFORNIA REAL ESTATE ASSOCIATION. San Francisco, March 3d. A. J. Shrader, President; H. Koster, Vice-President; T. P. Riordan, Treasurer; Wm. Monahan, Secretary. Directors: A. J. Shrader, H. Koster, Wm. Monahan, T. P. Riordan, David Landers, Michael Meagher, Owen McMahon, Denis O'Leary and Herman Zadig.

VIRGINIA S. M. CO.—White Pine, Nev. Trustees: Wm. H. Sharp, J. M. Byrne, L. F. Loveland, A. A. Whitney and Mark McDonald. President, Wm. H. Sharp; Secretary, John Ferrie; Treasurer, L. F. Loveland.

DANEY MINING CO. — San Francisco, March 4th. Trustees: H. F. Cutter, A. Cameron, Jas. Patterson, J. D. Fry and J. C. Wade.

DEPTH AND ORIGIN OF DONNER LAKE. Mr. Cadwallader, of the Central Pacific Railroad, has sounded Donner Lake to the depth of 1,600 feet without finding bottom. It is surmised that the lake occupies the site of a crater of an extinct volcano; but as the entire country is granite, this cannot have been a crater of the ordinary volcanic kind. Lake basins in granite do not take the circular shape of those owing their origin to volcanic craters. Though granite is usually considered to be eruptive rock, its elevation into mountains and the manner of its eruption in the remotest ages, are very imperfectly understood. Tahoe and Donner were formed by similar causes.

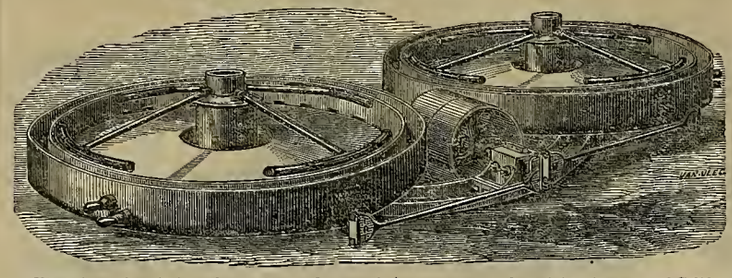
THE MINERS' CONFLICT with the Central Pacific Railroad Company will be argued in the Supreme Court next term, by Messrs. McConnell, Hale and Hamilton, on behalf of the miners. All the mining camps are making contributions to sustain their cause against the Railroad Company.

MARCH OVERLAND MONTHLY.—The solid articles this month are, "Our Manufacturing Era;" "How our Chinamen are Employed;" "Art Possibilities;" "Foot-prints of Early California Discoveries." "Up in the Pogonip" is replete with character.

ANOTHER Water Co., at Victoria, (V. I.,) to be "under the sole control of the Government," is proposed, with a view to bringing water from Elk Lake, five miles distant.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lamhard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

18v17cow

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice to forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited.

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H. Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

All communications should be addressed to the Secretary of the

PACIFIC PROTECTIVE ASSOCIATION,

S. E. COR. OF MONTGOMERY AND SACRAMENTO STREETS, (Over Donohoe & Kelly's Bank,) SAN FRANCISCO.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Evans' Corrugated Riffle.

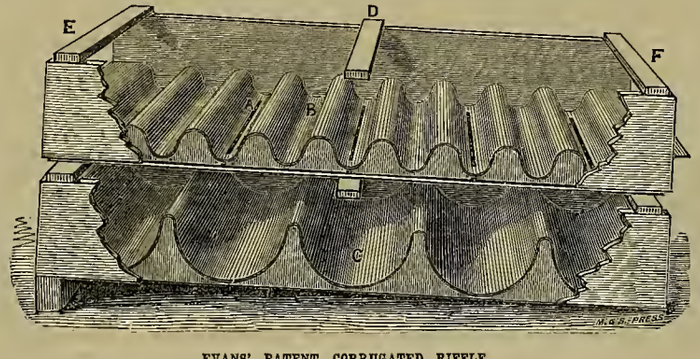
In our issue of October 17th, 1868, notice was made of the invention and patenting of Mr. George R. Evans' Corrugated Riffle, of which we herewith present an engraving. The object of this very simple and practical device is to save the mercury that leaves the battery, or other amalgamation process, in the same manner as, and in place of blankets, whose costly and perishable character render them of limited application. As the corrugated riffle of Mr. Evans has been applied in a number of Washoe and California mills, and as the verdict has been invariably favorable, so far as we are aware, a more definite representation of it will be of interest to our readers.

The pulp from the stamp mill flows into the riffle at E, and out at F, upon another section similar to the one represented in the engraving; as many of these sections being put together as may be thought best suited to the locality or to the ore. It will be seen that the riffle is a simple trough, the front side of which is left out in the engraving, having a corrugated bottom, and a slit, as at A, in every alternate corrugation, the object of which is to let the mercury and concentrated particles of ore through into the reservoirs below. The latter are little more than reservoirs, as they stand full of water when the apparatus is in operation, retaining all the heavier particles, while the lighter ones are overflown or carried from one into the other, and off. The corrugation semi-circles in the upper trough are 3 inches in diameter; and the dimensions for a trough suitable for a 20-stamp mill are 2 feet in width and about 30 feet in length. If such a contrivance will, as is claimed, perform the same work as three times that length of blankets, or even the same length, it is evident that the latter must speedily be superseded.

The effect of this semi-circular corrugation is that the particles of ore are so tossed, rolled and ground against each other, as to be alternately under the sway of the current, and thrown off successively into a series of eddies. An idea of the manner in which even light particles, like splinters of wood, are revolved in these frothing eddies, can be obtained only by witnessing the operation. After returning into the eddy five or six times, depending upon the quantity of water let on, the splinter finally receives an impetus from the current which carries it over into the next corrugation, where the tossing and grinding are repeated. Any other shaped riffle than that of semi-circular corrugation, encounters the difficulty of caking, rendering useless the amalgamated copper surface, as well as much of the mechanical advantage of the riffles, by filling them up.

The following result of a practical test, as given by a correspondent of the *Herald*, we subjoin:

The Superintendent of the Rhode Island Mill, Virginia City, in experimenting with this improved concentrator, placed it at the end of the line of sluices attached to the mill, thus making it third in the chain of apparatus for saving the gold and silver, and obtained good results. This mill reduces about 60 tons of ore per day, in the working of which there is a loss of between 75 and 100 pounds of quicksilver. The sluices catch about ten per cent. of this loss from the pans, thus reducing the absolute loss to from 67½ to 40 pounds per day. The first two days' run was so astonishing in its results that he thought there must have been some unusual leak connected with the pans, and therefore at once made a thorough examination and clean-up, but found nothing wrong. He then made another run of twelve hours with this concentrator attached, setting them at an inclination of one inch to the foot. The result was three common water-buckets full of rich sulphurets saturated with globules of quicksilver, while at the bottom of each bucket was a pool of the bright metal. There were at least 25 pounds of quicksilver in these three buckets, which of course contained a quantity of amalgam.



EVANS' PATENT CORRUGATED RIFFLE.

Evans' riffle may be seen in operation at the Nevada, Ogden and Rhode Island mills, in the vicinity of Virginia City. It has been ordered for a number of California mills, and also for Lower California. In silver mills it is next in order to the settler, and does away with the necessity for an agitator. In gold mills it forms a very excellent apron,—an important part in such a mill. It will also serve as a concentrator for sulphurets, saving the very lightest sulphuret particles. On the score of durability it is superior to blankets, in lasting about five years, while blankets will decay and become useless in from three to six months. The owners of the patent are George R. Evans, the inventor, S. P. Taylor, John White and Charles Cousins. The agent is S. P. Taylor, 416 Clay street, San Francisco.

Tin Mining in California.

The San Jacinto Tin Mining Company, which was recently organized in this city for the purpose of mining for tin at the locality popularly known as the Temescal Tin mines, some fifty miles east of Los Angeles, have now some thirty men employed in raising ore and opening up the mine, preparatory to still more extensive operations. A very rich streak of ore has been developed, from which about thirteen tons have already been delivered in this city. One hundred sacks were received by the last steamer from Los Angeles. The ore, as fast as received, is being crushed, pulverized and concentrated at the Union Foundry. It is first broken up to nut size in a rock-breaker, after which it is reduced to a very exceeding degree of fineness in one of Hunt's Improved Ball Crushers—a machine something similar to those in use for pulverizing quartz on the Mariposa Estate. After being thus pulverized the pulp will be concentrated by Hunter's concentrators.

The ore as delivered in this city averages from 12 to 15 per cent. of tin, and after being pulverized, is concentrated up to about 70 per cent. In this condition it will be taken to Mosheimer's Works, at the foot of Powell street, where a suitable furnace has been erected for smelting and refining the same. The present is merely an experimental test for ascertaining the value of the ore, and the thoroughness of the various manipulations through which it must pass to obtain metallic tin. About twenty tons of ore will be subjected to this test.

The principal work now being done at the mine is in the way of its development. Two shafts are being sunk, one to a depth of 100 feet, and the other 150 feet; these shafts will be connected with a drift 350 feet in length. From developments already made, the managers are confident that when the shafts and drift are completed, a body of about 125,000 cubic feet of 12 to 15 per cent. ore will be proven, which will yield about 12,000 tons. Should these anticipations be realized, an extensive plant of works will be immediately erected at the mine, and tin mining will be inaugurated in earnest on the Pacific coast. We shall watch with much interest, the progress of this preliminary work, and report results as soon as reached.

Since the above was written we learn that later intelligence has been received from the mine, stating that the vein has already been reached in the drift now in progress from the bottom of the 100-foot shaft. This development renders the continuance of rich ore in depth an ascertained fact.

Work at the Foundries.

Not as much work, in the way of mining machinery, is in hand at the foundries at present, as might be expected from the renewed interest that is generally taken in mining since the development of so many additional rich mines at White Pine. A single 20-stamp quartz mill at the Union Foundry, for the Stanford Brothers at White Pine, is the only order of the kind that we have heard of; though a number of other mills are on the tapis. A great number of old Washoe mills are being transported eastward.

At the the FULTON FOUNDRY there is in hand a sawmill for Crossman & Co., Red Bluffs; a flouring mill for Coghill, Harrison Fogus, or the "Reno Mill Co." at Reno, which is to have two run of stone; a steam engine, 12x24, for a sawmill at Fisk's mill, Sonoma Co., ordered by F. Helmke.

At the RISDON IRON WORKS, there is doing a great deal of steamship work, besides a propeller double engine for the Dry Dock Co., 22-inch cylinder and two feet stroke; another of the same size and kind for a tug for Capt. Kentfield; two boilers for the steamer Brisk, belonging to A. A. Cohen, for Oakland Ferry Co.; a steamer engine, 24x24, for another party; two engines, 22x5, for a side-wheel steamer for Capt. Tyler; new shafts for the steamer New World, of the valley railroad route; and repairs are being made on the steamers Senator, Antelope, China, Idaho, Princess, Constitution, the propeller California, etc. Mr. Moore, of the Risdon Works, has gone to England for the purpose of acquiring all that is new in the iron working art, and the company, having purchased thirty acres of ground on the Potrero, near the Rolling Mill, are about to erect new works of a capacity and with facilities that will be suited to the times. Mr. Cummings is the acting superintendent, in the place of Mr. Moore.

ARIZONA.—Charles Gentile, the photographer, has issued the prospectus of an illustrated work on Arizona; its Scenery, Climate, Geology, Natural Productions, Inhabitants, Present Condition, and Prospects in the Future.

THE Union Pacific Railroad was completed on the 20th to within seven miles of the mouth of Weber Cañon, which is virtually to Salt Lake.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press

Permanent Mining in the Salmon River Country.

Idaho Co., I. T., Jan. 25th, 1869.

Editors Press:—Having been a constant reader of the Press during a year past, I infer from the character of its columns that you would not object to mining items, even from the far-off North Idaho. The Press has occasionally during the year contained clippings from the Lewiston *Journal*, and from the Portland dailies, pertaining to our mines, but not enough has been anywhere published to furnish you with any clear, full and distinct conception of our district.

GEOGRAPHICAL.

Our district comprises a basin in the Salmon River range of mountains, and is bounded north by the main Salmon river, east by what is known as South Salmon, and south by a western tributary of South Salmon, which takes its rise within about four miles of the main Salmon, so that the waters of said river flow nearly around our district. Our area is about equal to that of a circle whose diameter is twenty miles. Near the center of this area are located what have long been known as the

WARRENS PLACER MINES.

These were discovered in the summer of 1862, the year of the great stampede to Florence, or what was then termed the Salmon River mines. The Warrens placers have been worked with much success every year since their discovery, between the months of April and November. The quality of the gold produced has even indicated the presence of silver, ranging in value from $10 to $14 per ounce. The hills and gulches within the basin are densely covered with a small growth of mountain pine, which grows straight and tall, and comparatively free from limbs till near the top, so that these forests can easily be penetrated by prospectors.

VEIN MINING.

Not till the summer of 1866, was there any stir in this district worthy of note, in relation to quartz, although the hills and gulches around the placers abound in rich deposits of drift gold and silver-bearing quartz. In June of that year the quartz attracted the attention of the miners so much that not less than 100 apparently distinct veins of gold and silver-bearing quartz were discovered, and upwards of 5,000 claims were located and recorded upon them. In the summer and fall of 1867, two mills were brought into the district. One of them was set in motion in November of that year. The other commenced operations in January 1868. These mills have reduced ores from about fifteen of these veins, mostly as tests of the veins, for free gold, more than half of which have disclosed average ore yielding upwards of $30 per ton, and some over $175 per ton in gold. Of the other veins discovered and yet unprospected by the mills, it is impossible to determine the value. Fire assays of samples from a large number of them warrant the hope that they will prove equally rich. Fire assays of samples from the silver veins show from $50 to $7,000 to the ton, but as yet the mills here have made but little effort to work for silver. In fact, they have not the appliances for working silver ore with success, and furthermore we have not among our miners men practically skilled in working for silver, save a few who know something of the Patio process which cannot be successfully adapted in this rigid climate.

DEVELOPMENTS.

Our veins, so far as developed, show a width of from six inches to three feet of quartz; but the deepest shaft sunk upon any vein in the district is seventy-five feet, and the amount of quartz extracted from all the veins will not exceed one thousand tons. No vein has been exhausted in sinking. On the other hand, most of them have increased in size, with an increase of depth of shaft. Some of them exhibit numerous breaks within the first forty or fifty feet in depth; in fact, the whole crust of the earth in this vicinity to the depth of fifty or sixty feet evinces the result of violent changes and commotions of former ages. What may be disclosed at the depth of a few hundred feet, no one can tell at present. Most of the veins are so situated that they cannot be drained to the depth of from one hundred to five hundred feet by drifts. The whole country around the center of this basin is a succession of hills and gulches of gentle grade, rising one above the other as we recede, till we reach the crest of the range of mountains, which border immediately on the Salmon rivers.

DEMAND FOR EXPERIENCED MEN.

Our district as described in general terms, may awaken some interest in your readers, though with the astonishing richness of the White Pine district and its surroundings, as portrayed from time to time in the Press and other journals, we can hardly expect to excite the multitude, who are eager to get rich quick. But we do want some experienced quartz miners here, and some first-class quartz millmen; and we want capital to develop our mines, and we think that when capital is liberally and judiciously invested in the quartz of this district, and under the contract of skillful quartz operators, it will give as steady and constant interest as the White Pine investments, though the percentage may not be so large in some cases.

DISTANCES AND COMMUNICATIONS.

We are distant from Boise City 140 miles, with a good natural wagon road the entire distance, save about twenty-five miles, and we expect that when that branch of the Pacific Railroad, of which the Press makes mention, extends to Ruby City, we will be a near neighbor to the denizens of your city of San Francisco. The twenty-five miles of road which requires to be built, would be through a natural gap in the mountains to the head of the Payette lakes.

Will not some San Franciscan, who has capital to invest, and who has the leisure for the trip, take a stroll up this way next summer, and see that we do not overrate things here? We look to the people of your State, and to the capitalists of your city, for taking ventures in all extensive mining enterprises, for their experience must have made them more sagacious than others, and less liable to fail. A. L.

The Leaching Process.

APPLIED TO SILVER ORES AT THE RISING STAR MILL.

Editors Press:—Some representations in regard to the results of leaching silver ores at the Rising Star mine, brought into circulation by some friends of mine in Virginia (Nev.), induce me to request you to insert the following few lines of rectification. The gentlemen referred to undertake to explain a process the nature of which they are not able to comprehend, simple as it is. It is objected that "all the silver is leached out together with the base metals, and lost."

If such a result could be possible, any millman of limited experience would perceive instantly (provided there is no special purpose for misrepresentation) that the difficult problem of treating refractory silver ores is solved at once. But as it is, the chloride of silver still refuses to be dissolved in hot water, even to oblige those gentlemen.

In the Mining and Scientific Press of Jan. 2d, it was explained how a small part of the chloride of silver can be dissolved, and carried out with the leaching water. The quantity varies from ½ to 1½ per cent., depending on the quantity of salt, and intensity of heat applied in roasting. This silver, although in a place where it is not wanted, is by no means lost; it precipitates by itself, and the only trouble is in taking it out. Being in the state of chloride, there is no difficulty in reducing it. But without taking this stuff into consideration, the ore of the Rising Star mine is now worked up to 91 per cent of the fire assay, yielding a metal of over .860 fineness. This result, compared with the previous extraction of iron without any loss of silver in the leaching water, is as favorable as could ever be expected; and the Rising Star mill has, by the aid of the present leaching process, become, now, a well paying institution. G. Kustel.

[Written for the Mining and Scientific Press.]

From Mount Diablo to Vallejo.

Editors Press:—In my last I gave you a detailed account of the coal mines, and what may be seen in them. The distance to the nearest point on the San Joaquin is only six miles, but the mines are situated so high up in exceedingly rugged cañons that, without the two railroads mentioned, they would be comparatively worthless to-day. A nearly level plain extends from the river back to the foothills,—within a mile of the Black Diamond Company's tunnels at Nortonville,—the same entering on the northeast of the mountain and then following the veins to the west.

From the verge of the plain up into the mines, a distance of a mile and a half, the Pittsburg and Somerville railroad has the remarkable gradient of 275 feet to the mile, cuts through one tunnel of 300 feet, and crosses eight large trestle bridges, the largest being 304 feet long and 60 feet high. As the coal cars would run down the grade of themselves, the only point to be considered was the construction of an engine capable of pulling them up again when empty.

This problem was solved satisfactorily by (Mr. I. M. Scott,) the mechanical engineer, of San Francisco. He devised and constructed an engine weighing 17 tons, and supplied the same with three pairs of thirty-six inch driving wheels, and powerful brakes. So successful was the result that in the construction of the Black Diamond company's railroad from New York landing to Nortonville, a grade of 305 feet to the mile was ventured upon; and similar engines are now running upon it with success. The cylinder of these engines is thirty-six inches, diameter 14x18. The Pittsburg and Somerville railroad is 5¾ miles in length; the Black Diamond or New York railroad is 6½ miles in length.

MOUNT DIABLO QUICKSILVER MINES,

about 4½ miles from Clayton in the northeasterly flank of Mount Diablo itself there is a quicksilver mine from which $8,000 was extracted, the product of a single pocket, in 1866. Further explorations have not developed any extensive paying deposits; and the company at work is scarcely able, from want of capital, to go ahead and prospect Diablo's bowels as the project merits. They hold on to the belief, however, that there is a good chance in the neighborhood to make a fortune. The Superintendent is Capt. Harding, of Clayton; the Secretary, I. Blum, of Martinez. About thirty persons are interested in the mine, mainly residing in different parts of Contra Costa Co. As an evidence that there is something in the mine worth owning, it may be mentioned that the title to it has been under litigation; but that matter has been settled by Harding's finally buying off the adverse claimats.

A tunnel is at present being run into the mountain 200 feet, perpendicular, below the old tunnel. The former tunnel was in 250 feet; the present one is in 200 feet; and at 250 or 300 feet they expect to strike the continuation of the pocket above mentioned.

Mount Diablo is at present covered with snow.

THE GOLDEN STATE POTTERY,

at Antioch, deserves attention in passing. Lohree & Co. are making all kinds of stone ware, from clay obtained at Marsh's, fourteen miles distant. Three kilns are in constant operation.

PACHECO,

on Mount Diablo's bucolic plains, is a thriving town, business of all kinds appearing brisk. I learned that H. N. Dalton, the agricultural implement manufacturer at Pacheco, who is at present putting up a very large agricultural implement manufactory, has been obliged, by the increase of work on his hands, to enlarge his establishment three times. His new works are seventy-five by about fifty feet in dimensions, and two stories in hight. He makes every kind of machinery that is required by farmers, and is building also a foundry in connection with his manufactory.

The farmers on the shady side of Mount Diablo are very busily engaged in putting in their crops.

BENICIA,

appears to be at a stand still at present, but faith is entertained by the citizens that a large town will grow up, as mills and manufacturing establishments are going up here, and large ships can come to harbor conveniently.

AT VALLEJO,

the frame work of the first elevator on the coast is going up in great haste; it is a very large building, situated at South Vallejo. R. W. Mackie is the chief builder, being a Chicagoan, who was specially sent for on account of his extensive experience in the building of elevators.

On Mare Island there are employed, in the government shops, about 750 men, and there is made now, in the way of machinery, everything that is required in connection with the building, repairing, and alteration of iron ships, and monitors, as well as of wooden ships. They make their own gas here of whale oil, which drops into a vaporizing retort from pipes connected with a reservoir in another apartment.

Vallejo, March 1st, 1869. *

[Written for the Mining and Scientific Press.

The Blue Lead Opened at Dutch Flat.

Editors Press:—The King Bros.' Mill and Mining Company, of which I spoke in my last letter, are now fairly into the lead, and have a sight in their drift that makes the eyes of old Californians sparkle, as in the days of '49 (as I predicted, you will recollect, "when they were fairly into the channel.")

They came up with a specimen of their cement; it is blue and yellow. The blue is cement, and the yellow is gold. One piece the size of a man's head, contains about $60, and on the edge of this same piece they scraped up over two ounces of gold.

Having reported these magnificent strikes, I will now give you the probable extent of this "Blue Lead" deposit at this place. The ridge is about one and a half miles long; that is about the distance from the King Bros.' claims to the Buckeye; and it has been drifted crosswise in both ends to the distance of seven hundred feet.

A large portion of the intermediate claims are now owned by Mr. James Teaff, who some time ago sunk a shaft in about the center of the ridge, and the same rich deposit, (that is now being worked at the two mills already in operation) is gone through. Numbers here have been down this shaft, Hon. E. L. Bradley, Mr. James Gould, Mr. A. Towle, and others, who, I think, all report the same. There is gold visible in the drift to the depth of thirty feet from the bedrock. It is the general opinion that this lead may be some seventeen hundred feet wide at this part of the channel, as it seems to have been the receptacle of several old channels making a junction. We are now hopeful of better times than we have ever had here, because the mills have proved a magnificent success, and the King mill will clean up a larger amount of gold than was ever had from the same amount of labor in Placer County, when they complete the present run.

Mr. Teaff informs me that at present he is unable to employ the necessay means and machinery to work his ground from his shaft, consequently, but a small portion (comparatively) will be worked until he is assisted by capital, for which there is no better chance that I know of in the State. There is enough of this immensely rich deposit to run twenty 20-stamp mills for twenty-five years, and it will not be "worked out" then.

Since writing the above, I have been shown richer and larger pieces of cement, just taken from the King Bros.' claims. Two hundred dollars was obtained from a single pan of the crushed cement, and a number of pans contained from two to six ounces of gold. There is a larger body of this pay channel, as I have stated, and it only awaits capital to open up a "golden stream" that will eclipse the pale "chloride luster" of White Pine.

I will give a particular description of the different strata or layers of the gravel deposit in the Teaff shaft, in my next, and note some of the singularities of the same.

A. E. R.

Dutch Flat, Feb. 9th, 1869.

Mechanical.

Apparatus for Taking Birds'-eye Views.—A new instrument named the "Ophthalmos," (Greek word for eye) has been devised for the above named purpose by a Virginia clergyman. Professor Williamson, of the Virginia Military Institute, describes it as an "automatic magnetic photographic camera, to be attached to a small balloon and elevated, without the operator, to any hight above the earth's surface, when, by a clock, working on a lever, in one form, and by an electro-magnet drawing the lever, in the other form of the invention, by the revolution of a disk at the lower end of the pendent instrument, the camera is opened and then shut and the photograph of the subjacent surface of the earth is instantly taken. At the same instant that the revolving disk operated by a coiled spring, opene the camera, the magnetic needle is fixed in its position by a mesh of wire that is thrown down upon it; and when the apparatus is drawn down by the ends the picture is found taken, with all the points and bearings of the compass."

Professor W. says that it will be of great use not only for making military reconnoissances, etc., but in the explorations of shoals, estuaries, and rivers to be made by the Coast Survey. Aëronauts testify that lakes, rivers and seas are transparent to a great depth when viewed from a balloon at a great hight. The geological formations at the bottoms of rivers are distinctly traceable by the naked eye from a mile's elevation above. Thus the rocks and reefs may actually be photographed for the mariner's use; and the general in the field may see the lay of the land for himself without being dependent upon the report of an aëronaut.

Steel in the St. Louis Bridge.—The following is from the report of Mr. Eads, the Engineer-in-chief for this magnificent work: "To insure a uniform quality and high grade of steel at the lowest prices, and at the same time avail myself of the advantages of the tubular form of construction, I propose to have the steel rolled for the arches in bars of 9 feet length and of such form that 10 of them shall fill the circumference of a 9-inch lap-welded tube about ¼-inch thick, in the manner that the staves of a barrel fill the hoops. This would virtually form a steel tube 9 inches in diameter and of 6 inches bore, the steel being about 1½ inches thick, and would be much less expensive than if the tube were rolled or drawn in one piece. The manufacture of steel in such small bars will insure a more uniform quality in the metal, and in the tube each bar will be supported against deflection in every direction. The tubes will be retained in their positions by an effective system of bracing, which will sustain the *voussoirs*, or pieces against which the tubes are butted throughout the arch. The upper and lower members of each arch will each be formed of two courses of these tubes, from end to end of the arch, each tube having a sectional area of 36 square inches at the summit of the arch. As each span would be made up of four arches, and each arch of four of these tubes, the span would have an aggregate sectional area at that part of 576 cubic inches of steel."

A Glue which will Unite even Polished Steel.—A Turkish recipe for a cement used to fasten diamonds and other precious stones to metallic surfaces, and which is said to strongly unite even surfaces of polished steel, although exposed to moisture, is as follows:

Dissolve five or six bits of gum mastic, each of the size of a large pea, in as much spirits of wine as will suffice to render it liquid. In another vessel, dissolve in brandy as much isinglass, previously softened in water, as will make a two-ounce vial of strong glue, adding two small bits of gum ammoniac, which must be rubbed until dissolved. Then mix the whole with heat. Keep in a vial closely stopped. When it is to be used, set the vial in boiling water.

Giffard's Injector and Morton's Ejector.—*Engineering* has the following: "Paradoxical as Giffard's injector appeared, at first sight, its action admitted of clear explanation. In a boiler under pressure of 100lbs. per square inch, equal to a head of water of 230 feet, the water would rush out of any opening with a velocity (were there no friction, atmospheric resistance, or loss of head) of about 121 feet per second. But were an opposing jet to move with a greater velocity it would drive back the escaping steam and force its own way into the boiler. This is what happens in the injector, and for a simple reason. A jet of steam moving with a velocity of perhaps 1,700 feet per second is instantly condensed in perhaps twelve times its own weight of water. The combined jet will then move with one-thirteenth its former velocity, or about 131 feet per second, the motion of the steam being wholly imparted to the water. Thus the jet, properly directed, enters the boiler.

"In Morton's condenser the escaping exhaust steam, properly directed, is condensed in, and its own motion imparted to, a jet of water previously set in motion by a small steam-jet, and the experiments recorded appear to show that the lateral action of the jet is sufficient to draw with it all the air that collects down to a vacuum of 12 lbs or 13 lbs. The abstraction of the air is perhaps the only thing that is really puzzling in the matter, unless it be that the very rapidity with which the stream concentrates upon and within the passing jet of water carries the air wholly against or even into the jet also. But there is one thing in the record of experiments which requires some explanation. The units of heat imparted to the injection-water were from 2·1 to 2·9 times those contained in the heat of condensation of the steam shown by the indicator. Not only this, but the steam represented by the increase of temperature imparted to the injection-water amounted to more than 60 lbs. per indicated horse-power per hour. It might be suspected that, notwithstanding the assertion that no steam was used direct from the boiler to keep the jet in motion, the little regulating valve was open, and thus it might prove that as much live steam was used to work the condenser as to work the engines themselves. This, however, is not said as in any way conclusive, but as a matter requiring explanation. The new condenser is at least the simplest and most interesting apparatus of the kind ever proposed, and we sincerely hope its results will equal in success those of the injector itself."

A Museum of the Elements of Machines.—A new plan is to be adopted in the collecting of machine models which is to be made for the Museum of Arts connected with the Massachusetts Institute of Technology. Models of the *elements* of machinery, and their simple combinations, are to be procured; not the machines themselves. The latter are so constantly changing, by improvements of every conceivable description, that a collection of them would be not only of immense bulk, and extremely expensive, but would very shortly be found to consist in large proportion of machines which are out of date and comparatively valueless. Moreover, as the object of the collection is to provide specimens for study, it is obvious that the end is attained far more effectually by means of models of the manageable elementary parts than by the more complex entire machines. It is the characteristic portion only which is the object of study. The elements are the *roots*,—and never change essentially. The *Scientific American* speaks of the idea as an excellent one; and shows that such a collection will be of great assistance to inventors themselves,—serving for them the same purpose that dictionaries and gazetteers serve for authors. An inventor, for instance, has a certain point to gain in the detail of the construction of his machine. A brief consultation of such a collection as this, settles the point, and saves much study. "Many simple and familiar contrivances are constantly re-invented. * * Without diminishing the field for inventive genius, it will instruct inventors as a class in what has already been done."

To Tin Iron.—Clean by immersion in dilute sulphuric acid and scratch-brushing, or by any other convenient method, and immerse in melted tin. If sulphuric acid is used for cleaning, the castings, after being scratched-brushed, should be dipped in a bath of limewater to neutralize the acid and then dried. They will take tin better by being first dipped in melted tallow free from salt. The tin should also have melted tallow on its surface while the dipping is going on.—*Scientific American.*

Scientific Miscellany.

Science for Grape-growers — The Oidium.—Many of the smaller fungi have two or more entirely different forms; which have at first been regarded as different species belonging to different genera. Several instances of this "dimorphism" are given by John L. Russell, in the February number of the *American Naturalist*. Among them is the "delicate mouldiness which covers the leaves of many plants, as the lilac, the grape, and the fruit of the gooseberry, and looks like strings of beads made of colorless cells,—in this condition known and described as *Oidium;* the spores being the self-same beads, and egg-shaped or oviform, whence the generic name. But careful observation will persuade us that this is not the perfect condition; later in autumn these threads become more compact, and are surmounted on their horizontal surfaces by shining black capsules, or perithecia, each of which is filled with elegant liptical and elongated cells, and these each in turn containing several spores. The famous grape mildew, so destructive to the foliage of the wine and table grapes of Europe, and known as *Oidium Tuckeri*, is thus only an imperfect form of some common *Erisyphe*, or mildew; and in this portion of Massachusetts, so far as I have observed, it is the *Uncinula spiralis* which attacked the foliage of the sweet water grapes at Salem, in 1850, and the same parasitic fungus which covered the leaves of the wild grape, Isabella, and other hardy varieties, and which can be detected every season to a greater or less extent."

Cause of the Blue Color of the Sky. In a recent lecture (Jan. 15th) at the Royal Institution, Professor Tyndall exhibited some of the experiments in the decomposition of vapors by means of the electric light, to which we have referred in a previous issue, and showed that the light from the blue sky is polarized by transmission through particles of some kind. The light of the blue cloud in the tube employed in the experiment aforesaid, was polarized in such a manner that it was completely stopped by a piece of tourmaline held parallel to the cloud; but if the tourmaline was held at right angles to it, the light passed freely. Examination of the light from the blue sky in a similar manner at sunset, by means of a prism of Iceland spar, showed that it was transmitted at one angle by the prism, but at another was quenched. The sky and clouds were differently polarized, for in his prism he could get a dark sky with light clouds, and black clouds with a background of light sky. The greatest polarization was at right angles to the track of the solar beam. The experiment with the tube proved that it was only necessary to have very small particles in the atmosphere to produce blue sky and the polarization of the solar light. What these particles are is doubtful. Possibly the phenomena may be due to the slow formation or melting away of the clouds.

Archæological.—The American Consul in Larnaca, Cyprus, was recently led to make excavations at the village of Dali, the ancient Idalium, by the reports of a peasant. The result was, the discovery of an ancient Greek necropolis at a depth of only three feet, under which were older Phenician graves, oven-shaped, and closed with great blocks of stone. In some of them were found vases with Phenician inscriptions and statuettes of women. The spoils of the Grecian tombs are exceedingly rich. Among the articles are golden necklaces and ear-rings, silver bracelets, copper, and bronze battle axes, lance and spear-heads, mirrors, tripods, coins, medallions, gems (especially of amethyst, ruby, and agate), glass vessels, statuettes, busts, and a great quantity of objects in terra cotta. Many of the painted vases are three feet in hight. What disposition will be made of these treasures has not yet been announced.

The Metal Hydrogen.—We have before alluded to the announcement that Dr. Graham has probably verified the conjecture of scientists, that hydrogen is a metal. The extraction of a large amount of occluded hydrogen from the Lenarto meteorite, which astonished the world a year or so ago,—as our readers will remember,—was a step towards this splendid conclusion. Professor Graham has since experimented largely in this direction; and, as we have seen from time to time, has succeded in artificially occluding this gas in iron, platinium, palladium, and other metals. In other words, he has, by causing any one of these metals to *absorb* hydrogen,—as melted silver absorbs oxygen, or as water absorbs ammonia,—produced an *alloy* of that metal with hydrogen; which alloy is less dense, but more magnetic, than the aforesaid metal alone. Palladium occludes, or "shuts up," or absorbs, eight or nine hundred times its volume of hydrogen. This gas, so volatile in its character, is thus effectually imprisoned, so to speak, as to its particles, between the particles of the donser metal; and the resulting compound metal, partakes, like other alloys, of the charactere of both its constituents. Professor Graham has, by calculation, found the density of hydrogen to be 1.951.

Death of Professor Forbes.—James D. Forbes, D. C. L., died on the last day of the year. He was a scientist of note. For twenty-six years he was Professor of Natural Philosophy in the University of Edinburgh, to which Chair he was elected at the age of twenty-three, in preference to Sir David Brewster, who was a candidate for the position. He was Fellow of the Royal Society of Edinburgh, Fellow of the Royal Society of London, Corresponding Member of the Institute of France, Fellow of the Geological Society, and member of various other scientific societies at home and abroad; and he received the degree of D. C. L. from the University of Oxford. His scientific investigations in reference to heat and light, were original and important. He was the first to prove the *polarization of heat*, and the first to investigate the *laws of glacier motion*. He is the author of a multitude of papers upon scientific subjects.

Different Constitution of Different Planets.—*Fraser's Magazine* has an article entitled "The Materials of our Universe," in which the writer thus speaks of the testimony borne by the spectroscope to the diversity of constitution among the planets: "It has long been known that, on earth, the interruptions in the solar light are unchanged by reflection, even from an irregular surface. If, then, the spectra of the planets are not faithful reproductions of that of the sun, the difference must be due to a diversity of elementary constitution—and probably in the quality of the surrounding atmosphere. The moon, thus interrogated, 'takes up the wondrous tale' in accurate repetition, according with the absence, or rather the extreme tenuity, of atmospheric covering. Venus, too, shows no deviation. But it is otherwise in Mars, Jupiter, and Saturn, the light of each of which indicates a something which would probably not be visible in the terrestial spectrum viewed from a corresponding distance, and which leads to the impression that their atmospheres, though in general character similar to our own, contain elements not identical with those which surround our globe."

Test for a Free Acid.—Mr. E. Smith, gives the following in the *Chemical News:* "Dissolve chloride of silver in just sufficient ammonia to make a clear solution. If a little of the test be added to ordinary spring water the carbonic acid present in the latter will neutralize the ammonia, and precipitate the chloride. The above forms a good lecture experiment, the test being a very delicate one."

Nitrogen Gas.—Signor M. Levi, an Italian Chemist, has made known a new method of preparing this gas. It consists in heating bichromate of ammonia in a retort; the salt is by this means resolved into green oxide of chromium, water, and nitrogen gas.

Contributions for our Cabinet.

Nos. 365, 366, 367, 368 and 369.—Auriferous sulphurets, from Hites' mine, Hites' Cove; Harhor mine, Snow Creek; Ferguson mine, near Hites' Cove; Oakes & Reese and Lafayette mine, Hunter's Valley, Mariposa County. Presented by agent.

Nos. 370 and 371.—Peacock copper ore, and hlue carhonate of copper, from Hunter's Valley, Mariposa County. Presented by agent.

No. 372.—Gold iu steatite, from Dr. Hill's mine, Angel's Camp.

No. 373.—Micaceous iron, from Angel's Camp. Dr. Hill.

No. 374.—Pyrites, apparently hut not actually coutaining nickel. Dr. Hill.

No. 375.—Croppings of Tuscon mine, Treasnre Hill, containing chloride of silver. Presented by C. H. Dewey.

No. 376.—Cinnahar; a very rich, pure specimen, crystallized in small prisms; mixed with iron pyrites. From the Mount Diahlo Quicksilver mine, near Clayton. Capt. Harding, Superintendent.

No. 377.—Quicksilver, from the same.

No. 378.—Arragonite (rhomhic or prismatic carhonate of lime,) found in Tuolumne county, hy Mr. Johnson, and supposed hy him to he identical with a very excellent flux mineral which he has seen used in Nevada, but which was probahly fluor spar.

No. 379.—Jasper. Presented by Dr. Hough, Martinez.

No. 380.—Fossils from from Tertiary or Cretaceous rocks, near Martinez. From Dr. Hough.

No. 381.—Magnesite (carhonate of magnesia), containing a little alumina. From W. Frank Stewart, of San José, who says: "This substance occure in extensive gangues, hetween granitic and metamorphic rocks in the Mount Diahlo range, six miles eastwardly from San José. The beds of this mineral are inexhaustihle and easy of access, and if it proves to be what I think it is, will be valuable.

The Tin and Copper Market.—We extract the following from Winterhoff's Metal Circular, dated New York, Feb. 4th:

Tin has advanced, with quite a large business, to 31½c. gold for Straits, 32½c. for Banca, and 30c. for English. The supply for the spring trade is thus very small, and it is probable that we shall have to draw a little Straits from England, although our prices are still 10 per cent. below the cost of importation from there. The stock is all in speculators' hands, viz. 10,500 slahs Straits, 1,200 slabs Banca and Billiton, and 50 tons English, equal to 1,500 slabs; total New York and Boston, 13,200 slabs, against 11,900 slahs 1st Fehrnary, 1868. In Singapore the quotation was $26½ on the 20th January. The production of England and the East Indies for 1868 is estimated at 19,600 tons against 21,500 tons in 1867; the consumption of Europe and America last year has on the other hand increased to 22,500 tons against 21,500 tons in 1867. The stocks in London and Amsterdam, including the expected arrivals amounted on the 1st January to 8,000 tons, against 10,100 last year, and 11,800 tons in 1867. The consumption of Tin plates, as well as the raw material, is likely to he still more stimulated by the introduction of tin cans and cases for the transportation of petroleum now coming into use.

Copper has been largely dealt in on speculation, and is quoted to-day 26¾c. for Baltimore, 26¾c. for Lake Superior; an advance of 3c. per pound since the 1st of January.

The Tariff Bill passed hy the House and amended by the Senate is again to he voted and will prohahly hecome a law. The smelters in the Atlantic States have almost ceased operations, and at Lake Superior the production has heen very small during the winter. The consumption is good, and there is every prospect of a still further rise in the price.

The London market was quoted on the 30th ult., £74 for Chili bars, a decline of £1 from the highest point in the middle of January.

45 tons Quincy have been shipped from Havre to our port, and probahly a few more parcels may come back.

New Patents Issued to Pacific Coast Inventors.

For the Week Ending February 9th.

86,648.—Improvement in Wagon-Brake Blocks.—Heman Crowell, Washington Corners, Cal.:

I claim confining the hrake hoards or strips F, F, to the hrake hlock hy the clips C, C, provided with longitudinal pieces D, D, having points E, E, or the ends of the clips hent at right angles over the said strips, substautially as described.

The rubbing hoards or strips are held by clips, the shanks of which pass through the hrake-hlock, where they are held and adjusted hy set-crews.

86,677.—Improved Apparatus for Confining Horse Powers.—Richard Knott, Suisun, Cal.:

I claim the hars B, B, and D, D, rods C, C, and straps E, in combination with the frame A, the whole constructed and arranged substantially as and for the purpose ahove described.

This device cousists in the combiuation and arrangement of iron bars and stakes in securing horse-powers to the ground.

86,681.—Improvement in Machine for Cutting Grape Vines.—Louis W. Mayer, Sonoma, Cal.:

1. I claim the vine-cutter, consisting of the stationary knife E, and the revolving knives a, a, a, or equivalent device, together with the feeding-hopper or trough H, the whole constructed and operating suhstantially as and for the purpose described.

2. I claim the long curved fingers b, h, h, for taking up the vines, together with the revolving arm G, and its fingers c, c, c, or equivalent device, for carrying the vines to the feeding trough or hopper, suhstantially as herein described.

This is a machine for cutting grape vines which have becn pruned from the main vine into small pieces, in order that they may be nsefnl as a manure, by being turned under by the plow and allowed to rot, thus restoring to the ground the suhstance which is drawn from it to produce the vines. It is a well-known fact that where the grape is grown for a series of years upon the same spot, the ground will lose in a great measure that substance which is required to nourish them. The invention consists of a frame mounted upon two broad-faced wheels furnished with inside gearing in which pinions operate for driving the knives or cutters, which are attached at intervals aronnd the pinion shaft, and stand at an angle. A stationary knife is also attached to the axle of the wheels. Passing across the frame back of the wheels and turning loosely on small axles which have their hearing in the side timhers of the frame, is a shaft, from which long curved fingers, which sweep the ground in front, depend and gather up the vines. To one of the wheels near its face is attached an arm which carries a series of shorter curved fingers, which, passing around with the wheel, take up the vines from the long fingers, and drop them into a trough over the knives, where they are caught by the knives and cut into small chips, which fall to the ground heneath.

86,695.—Improvement in Sewing Machine for Sewing Leather.—William Wilson Russell, Tepic, Mexico:

1. I claim in combination with the swinging head M, the double wheel G, and the awl and needle-carrying arms H and I, suhstantially as described.

2. I claim the combination with the head M, and arm S, provided with adjustable rollers, of the cams or plates P and R, suhstantially as described.

3. I claim the combination of the hook V, with the awl L, making a hole for the needle, for taking, carrying forward, and holding the loop until the needle descends through it to form a new one.

4. I claim the combiniou of the awl L, and the needle K, when so arranged that the rising of the needle-holder lifts the presser, and the awl moves the material the length of a stitch, hefore withdrawing from the hole it has made, to give place to the needle, substantially as described.

The object of this invention is to provide an improved machine for stitching leather and other heavy, firm materials, and it consists in the employment of an awl which first pierces the leather for the passage of the needle. This needle is passed into the same hole by an arrangement of cams which produce a peculiar swinging motion of the head of the machine, and they may also he regulated so as to give a long or short stitch as desired. It also consists in a peculiar movement of the hook or looper, which takes the thread from the needle and holds it till the needle leaves the leather, then advances and forms a loop for the awl and retires as soon as the point of the awl passes the loop, so that the leather can feed at the same time the thread is tightening around the awl.

86,880.—Improved Drill Stock.—Edward A. Stockton, San Francisco, Cal.:

I claim the roller E, the inclined pieces D, and the spring C, arranged in handle B, and combined with the drill-stock A, substantially as and for the purpose described.

This invention relates to a new mode of operating a drill-stock by means of a friction roller placed in an inclined recess or chamher on the inside of the eye of the handle, so that by moving the handle in one direction the roller is moved into a deeper portion of the recess, and allows the handle to turn freely on the stock in that direction. By reversing the movement of the handle the roller moves up the incline and hinds against the stock, and moves it also, and at the same time the drill is fed hy a screw in the usual manner.

The following are from the list published last week,—with additional descriptions.

86,564.—Improvement in Elevator and Table for Feeding Grain Separators. Don Carlos Matteson and Truman Pane Williamson, Stockton, Cal.:

1. We claim the cross-bar D, and the boxes or eyeholts E E, substantially as and for the purpose specified.

2. We claim the hinged-drop bar K, and the holding-hraces N N, constructed and operated suhstantially as and for the purposes herein described.

This is an improved movahle elevator and table for feeding the nnthreshed straw from the stack to separators, dispensiug with much of the manual lahor heretofore necessary. The whole machine is so constructed that it can he easily moved from stack to stack as required. A tahle is constructed of sufficient size to hold the necessary quantity of straw to feed the thresher or separator, and is mounted upon wheels having a pole and the usual devices for attaching horses to move it. A derrick of considerahle hight rises from the table, its foot heing pivoted on a movahle har beneath the tahle. The elevating fork is attached to a rope passing over a pulley at the top of the derrick, and thence to another beneath the tahle, so that horse-power may he used to elevate the straw. In order to place the latter pulley low enough, it is fastened to a har which is hinged at one end to one of the side sills of the machine. The other end is dropped on the ground and to adjnstahle braces passing from it to the opposite side sill, to keep it down when in use. Whenever it is necessary to remove to another place, the hraces are disconnected and the cross-bar drawn up out of the way.

86,565.—Improvement in Horse Hay Forks.—Don Carlos Matteson and Truman Pane Williamson, Stockton, Cal.:

1. We claim the plate O, with its lugs M M and *u*, and the spur P, constructed and arranged suhstantially as herein described.

2. The stirrup A passing around the post N, suhstantially as and for the purpose described.

This is an improvement for strengthening hay forks at that point where the strain comes in operation, and it consists in hinding the head or cross timher to which the tines are attached and the upright post together without a mortice, by means of iron straps and hands, which closely and firmly hold them. In a horse hay fork, the point where all have so far failed to withstand the rough usuage they are suhjected to, is at this junction of the several parts, on account of the cutting away of the wood necessary to secure them and give them a proper amount of firmness.

After the 13th inst., the San José Railroad trains will run as far as Gilroy. The *Bulletin* furnishes additional points in favor of the early prosecntion of construction on the Southern Pacific Railroad.

DEWEY & CO.

U. S. AND FOREIGN

PATENT AGENCY

FOR THE PACIFIC COAST.

Office, No. 414 Clay Street,

SAN FRANCISCO.

Letters Patent.

A patent is an open letter, embodying all tho language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and tho Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is nssignable, but cannot be seized and sold on execution.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is npplied for, and while the inventor is perfecting his design. When *properly* made, it operates as n bar to applications respecting tho same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office nlways returns a receipt for caveat papers, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

What Claims can be Patented?

A knowledge of Ancient nnd Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables ns to determine in n measure in all cases what can be patented, and how much can he claimed ns new and novel, and be covered hy Letters Patent. This is one nf the most difficult questions encountered by both old nnd new inventors—one in which nn experienced counsel is of great service.

Confidential Advice.

We invite consultation (in person or hy mail) regarding new inventions, for which we make no charge. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests gnarantee, and the thonsands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

Advantages of Our Agency.

Inventors on the Pacific Coast can sign the papers at once, and save nt least two months' time in securing patents through our office. When desirable they can visit and give us personal explanations—better than written instructions.

We assist in hringing valuable inventions to the general notice of the public throughout the Pacific Coast hy illustration or description in the columns of the Mining and Scientific Press.

From long experience in the business, and nn intelligent nnd thorough nnderstanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents*.

We gnarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are actually secured cheaper through onr ngency than nny other, however flattering may be the inducements nffered at the commencement by others.

Extensive practice gives us great facilities. securing regularity in the transactinn of onr business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

Information for Inventors,

Printed in circular form, containing list of Government nnd other fees, sent free.

We draw up legal assignments for patentees; record nssignments in the Patent Office; procuro copies of United States and foreign patents; make examinations here and nt Washington regarding the patentability of inventinns; take up and prosecute rejected cases, depending npon success for our fees; reissnes taken out; interferences prosecuted —in fact, every legitimate branch of the patent agency business is thoronghly conducted by us here and our branch agency in Washington.

California inventors should beware of placing their inventions and money in the hands of persons not well known as honest, responsible and capable.

Patent Office Reports.

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801 to 1845, and full files of scientific papers containing illustrations and list of U. S. Patent Claims, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the Mining and Scientific Press contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

DEWEY & CO.,

414 Clay street, below Sansome, San Francisco.

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board

San Francisco, March 13, 1869.

City Stocks.

The miscellaneous share market has been characterized by slightly increased activity over the transactions of the previous week. We note sales of Pacific Insurance stock at $128. One hundred shares of National Insurance stock (this company is now winding up its business) sold at $86 per share. The San Francisco Ins. Co. (also in course of liquidation) will hold a meeting on the 16th inst. The assets of this company continue to pay very handsome dividends to its stockholders. Gas stock was in the market at $80@79, sales to a considerable extent having been effected at these figures. Spring Valley Water sold at $68 50@68.

The amount of marine premiums paid to the several insurance companies of this city, for the three months ending January 31, 1869, as compared with the quarter ending October 31, 1868, are as follows:

Companies.	Jan. 31, '69.	Oct. 31, '68.
Merchants'	$65,012	$76,972
Pacific	42,531	65,705
Union	41,896	62,079
California	33,288	41,649
Fireman's Fund	18,563	18,460
Occidental	11,249	6,389
Home Mutual	8,836	6,136
Total	$221,375	$277,390

Showing a decrease of $56,015.

The Bank of California disburses its usual monthly dividend on the 15th inst.

Mining Share Market.

During the past week the mining share market manifested a slight recession from the activity that prevailed during the previous similar period; however, there was a larger variety of stocks disposed of, though the transactions did not aggregate so large an amount. Prices were also somewhat off; and, as a general thing, the market was not so firm.

Opnir—declined from $39 to $34, and at the close realized $35. The long continued hardness of the rock in the lower drift is quite unexpected. On the 9th inst., they cut a strong seam of clay, but it produced no change in the rock. The probabilities are that it indicates a near approach to the ledge. On the 10th inst., the drift had attained a dista ce of 74 feet.

Imperial—sold within a range of $110@101 50, improved to $107, and closed yesterday at $103 50. The operations in the lower drifts have not yet shown any favorable developments. On the 12th inst., the drift from 1,000 level was in 72¼ feet, and on the 1,100 level 44¼ feet of drifting had been accomplished.....Kentuck was in moderate request at $255@270, and at the close sold at $265. The hullion returns in February amounted to $54,014 against $83,335 in January. No dividend the present month.

Hale & Norcross—has been in good request, selling with a range of $93@88, then at $90, and closing at $88. The eighth annual meeting of the stockholders of this company was held on the 10th inst. From the President's report we make the following extracts:

From the third station to the fourth—from the sill floor in third station—it was, from appearances, confidently anticipated that in going down to fourth station, that the ore would widen out and prove richer as we went down on it, but it pinched out in going down, and the ore deteriorated in value or grade, so that in reaching and drifting in on the fourth station we did not find a continuous ledge from third to fourth stations. In the fourth level, or station, so far as opened, ore has been developed north and south. In the north drifts and cross-cuts, portions of the ore is high grade, while portions of it are only fair and low grade. In the south drifts, from main tunnel, the ore developed thus far is of low grade. In upper levels, say from one hundred and seventy-five feet from surface down to three or four hundred feet, there are large quantities of low grade ore, which, under present prices of mining and working ores, do not pay the company much, if any profit, to mine and work them, as in drifts below these low grade ores do not pay a profit to take out and work, but a reduction in mining expenses and milling, would pay the company a handsome profit; hence these low grade ores have not been taken out to any extent. In this view of the case, and with a view to lessen the expenses of mining and working all ores, the price of wood and timber must be reduced, which, in working the mines (at and around Virginia City), are the heaviest items of expense in mining and working the ores. To effect this, the transportation of wood and timber, from districts producing them, must be reduced, which can only be accomplished by railroad facilities. The Truckee Railroad Company propose and will, no doubt, effect this object, and reduce the price of wood and timber about one-half, or at least fifty per cent., as well as upon the price of other material required at the mines; it being a foregone conclusion that this railroad will be completed during the ensuing year. Therefore, it is almost certain that the expenses of working the mines will be reduced as soon as the Truckee Railroad is completed and in working order, at least fifty per cent., which will enable the Hale & Norcross mine to work all their low grade ores at a handsome profit. To accomplish this desirable result, it was necessary that the different mining companies should aid in the construction of this road, by advancing certain sums of money to the Truckee Railroad Company, to be reimbursed to the mining companies in freights of all kinds of materials required at the mines, at fair and moderate rates. Seeing and believing that the construction of this railroad would enure greatly to the benefit of this and all other mining companies in this section, and eventually be a great saving to the mining companies, the Board of Trustees deemed it advisable to subscribe and advance to the railroad company $25,000, payable in monthly installments of $5,000 each—first installment payable 15th March, inst., and monthly afterward, to the amount of the subscription ($25,000). The recent developments in the mine are more encouraging, showing considerable improvement, with the drift from the shaft on the fifth station, now in some seventy feet, which will soon reach the veins above, and it is hoped and believed, will soon place the company in a more flourishing condition.

From the Secretary's report we obtain the following financial facts:

RECEIPTS.

Cash on hand February 29, 1868	$3,918 18
From assessments	201,960 00
Bullion and ores sold	395,691 77
Fair shaft account—transfer of materials to mine account	19,542 35
Cash for amount of overdraft at Bank of California	4,637 00
Sundries	4,720 21
	$630,469 51

DISBURSEMENTS.

Mine account	$275,286 79
Ore account—reduction	216,775 47
Machinery account	9,345 55
Fair shaft account	12,278 90
Salary account	13,100 00
Bank of California	61,784 72
Bills payable	7,283 68
Sundries	34,477 26
Cash on hand	137 74
	$630,469 51

The expense of reducing 16,535¼ tons of ore amounted to $13 11 per ton. During 1866, the hullion yield aggregated $1,355,220, equal to $47 32 per ton; in 1867, $864,998, equal to $34 14 per ton; in 1868, $395,146, equal to $23 89 per ton. The statement shows an excess of assets over liabilities amounting to $218,-981 51. Assessment No. 34, of $5, has been rescinded. On the 10th inst., there was from three to four feet of ore in the wiuze to the fifth station, and reported to be of improved quality. Necessary dead work has prevented sending out larger quantities of ore from the fifth level.

Savage—sold quite largely at $71@64 50, closing at $65. A dividend of $4 per share is payable since the 11th inst. The bullion returns for February aggregated $174,300 against $176,700 in January....Yellow Jacket exhibited a fair degree of activity, selling at $71@69, and closiug at $68 50. A dividend of $5 per share is payable ou the 15th inst. This company is said to have reached an excellent paying body of ore in a very considerable quantity.

Amador (Cal.)—closed at $290. This company continues to maintain its well-merited reputation. The bullion for February account is the largest yield for any one month, reaching $65,400. A dividend of $10 per share was paid on the 9th inst....Eureka (Cal.) shows a hullion yield of $22,500 for the first twelve days' run of the present month. A dividend of $5 per share is payable since the 10th....Confidence sold at $40@34. No hullion returns during the month of February. On the 11th inst., $3,066 came to hand.

Alpha—was quite active at a decline, receding from $51 50 to $42 50, and closing yesterday at $44. On the 11th no change had taken place in the southeast drift. They had cut eight feet into the quartz and porphyry on the east side of the clay. The northeast drift is in more quartz, and is said to look quite favorable for ore. Work proceeds slowly, on account of hardness of rock ...Chollar-Potosi changed hands at $174@163, and closed at $165. During the week ending March 5th, they extracted 740 tons of ore. Nothing of a favorable nature from the mine. The bullion receipts during the month of February amounted to $74,869 against $50,700 in January.

Pocotillo (White Pine)—was in the market during the week at $20@18 50 per share..... Large sales of Silver Cord (Idaho) were made at $17 50@15.

The sales in the San Francisco Stock and Exchange Board since last Saturday amounted to $1,547,566.

Boring for Horizontal Chloride Deposits.

A correspondent of the White Pine *News*, says: "Several gentlemen, with the assistance of Mr. Stanton, are *boring* for mineral. The present pioneer work in that line is on the Lapatria mine, west of the Eberhardt mine, and to the right of the road leading to that mine. The work is prosecuted so quietly by two men that one can hardly find them, and yet they are doing good service. I believe it to be the proper mode of prospecting here where the ore seems to be under the limestone lying horizontally."

Tide Lands at San Francisco.

The map of the tide lands in this city and county, prepared by Engineer Allardet, has been completed, and a copy is being prepared for the office of the Secretary of State. The Board of Tide Land Commissioners have not as yet passed upon the numerous claims which have been presented, but have them under an almost daily consideration. It is more than likely that these claims will be so far settled that the railroad reservations may be made in a few days.—*Herald.*

MINING SHAREHOLDERS' DIRECTORY.

The Inter-Oceanic Canal.—Captain W. G. Somers, Commander of a steamer on the Magdalena River, Columbia, South America, has arrived at Washington with dispatches from Bogota for the State Department relative to the mission of Caleb Cushing and the Darien Canal. The mission is considered, at Washington, as a complete success.

Not an Excitant.—Persons unacquainted with therapeutics are apt to suppose that medicines containing a diffusive stimulant must necessarily excite the brain. This is a great mistake. The Plantation Bitters, for example, contain St. Croix Rum (the purest and most nourishing of all forms of alcohol, by the way), yet so completely is the exciting principle of the spirit controlled by the rare vegetable substances with which it is impregnated, that the Bitters calm and tranquilize the brain and the nerves instead of spurring them into preternatural activity. Thus, the spirituous element becomes a harmless agent for the rapid diffusion through the system of the most valuable specifics for indigestion, general and local debility, intermittent fever, constipation, liver complaint, and all disorders of the secretive organs.

Valuable and Popular Practical Books.

Painter, Gilder, and Varnisher's Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Varnishing, and Glass Staining, with numerous Useful and Valuable Receipts; Tests for the Detection of Adulterations in Oils and Colors, and a statement of the Diseases and Accidents to which Painters, Gilders, and Varnishers are particularly liable, with the simplest methods of Prevention and Remedy, with directions for Graining, Marbling, Sign Writing, and Gilding on Glass To which are added Complete Instructions for Painting and Varnishing. 12mo, cloth ... $1 50

The Practical Brass and Iron Founder's Guide—A Concise Treatise on Brass Founding, Molding, the Metals and their Alloys, etc.; to which are added recent Improvements in the Manufacture of Iron, Steel by the Bessemer process, etc By James Larkin, late conductor of the Brass Foundry Department in Reany, Neafie & Co's Penn Works, Philadelphia Fifth edition, revised, with extensive additions. In one volume, 12mo ... 2 25

A New and Complete Treatise on the Arts of Tanning, Currying, and Leather Dressing—Comprising all the Discoveries and Improvements made in France, Great Britain, and the United States. Edited from Notes and Documents of Messrs. Salleron, Grouvelle, Duval, Dessables, Labarraque, Payen Rene, De Fontenelle, Malapeyre, etc. By Prof. H. Dussauce, Chemist. Illustrated by 212 wood engravings. 8vo ... 10 00

The Miller's, Millwright's and Engineer's Guide—By Henry Fallett. Illustrated. In 1 vol. 12mo ... 3 00

American Miller and Millwright's Assistant. By Wm Carter Hughes. A new edition. In one volume, 12mo ... 1 50

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is already, and will be sent free of postage to any one who will favor me with his address.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

Markleeville *Miner*, Feb. 27th: Work has been commenced on the Alpine tunnel, now in 58 ft., which will he continued in to intersect the underground workings of the Tarshish mine, thought to be not over 300 ft. distant.

The Illinois California Co., which has been operating iu the granite of Raymond district for several years past, has suspended work.

The Morning Star shaft is now down so near the lode that small strata of ore are being encountered, and the appearance of the ground is very encouraging. The company have portions of the castings for more roasting furnaces to be put up at the Pioneer mill, along the way from Cisco to Carson, and will probably get the mill running again as soon as the roads are in order for the delivery of ore. Parties are desirous to work the Star ore, refractory as it is, at $14 per ton and work it closer up to an assay than is done with Comstock ore. It is further intimated that the second class ore will pay over $100 clear profit per ton.

The new Hagan furnace at Angel's has been running for some time, and some of the roasted rock has been sent to San Francisco and examined. The sulphur was driven off, and so far as an opinion can be formed from the specimens examinod, the success was complete in roasting.

AMADOR COUNTY.

Jackson *Ledger*, March 6th: The mill of the Coney Mining Co., after undergoing a thorough overhauling, and being greatly strenghtened, was started up on Thursday evening, and is now hammering away.

Jackson *Dispatch*, March 6th: We noticed the other day, that some of our citizens had commenced sinking a shaft—or rather a prospect hole—on what is supposed to bo a rich quartz lead, right in the heart of town, on Court street. We did not learn how much the rock was expected to pay per ton, but were informed that the proprietors contemplate the erection of a mill on the lead immediately.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, March 6th: The timber for the new hoisting works to be erected on the Palomo mine, in Lower Rich Gulch, are being hauled as rapidly as possible, and the work will be pushed forward to an early completion.

York, Smith & Co. have purchased the mill formerly in use on the Radford claim, and are husily engaged in transporting it to their quartz lead in Jackass Gulch. The company have developed what promises to be an excellent claim in that locality. More energy is being exhibited this spring, in quartz mining, than ever before.

Since the commencement of the fair weather, mining operations have been renewed with increased vigor. At Railroad Flat labor has been resumed upon all the claims temporarily abandoned during the storm, and pay rock is being extracted in large quantities. The enstom mill heing erected at the Flat, by Mr. Smart, is nearly ready to commence operations, and will afford the miuers of that locality increased facilities for crushing. The celebrated Petticoat mine continues to yield the precious metal with its usual liberality, their mill being kept coustantly employed in crushing ore which averages $100 per ton. This is the most productive claim in the county, and when its resources and wealth are fully developed, it will eclipse any in the State. Sanderson & Co., Gay & Co., the Balmoral, Chemisette and others, are being worked with profit to their owners. All the mines in the district are looking favorably, and the prospects for the future were never brighter.

At West Point, with the opening of spriug, we have the assurance that operations in quartz will he resumed with spirit. West Point was once the "banner" district of the county; hut the ahundance of water has heen too great an obstacle for the miners, with their limited means, to overcome. Proper machinery is now heing erected on several claims, however, to obviate this difficulty, and as the season advances we expect West Point to regain its former flourishing condition.

In Lower Rich Gulch, work is being prosecnted vigorously and successfully. Alexander & Co. are running their mill day and night, and it is giving a first-rate account of itself. This company have been remarkably fortunate from the start. Their mine paid from the commencement of work upon it, and their mill has never been allowed to remained idle. The Palomo Co's mill is not running, it being impossible to get out ore until the new hoisting works are completed. When they are finished, the mine will be thoroughly developed. Norton & Co. are still running their tunnel, endeavoring to find the lead.

From Angels the reports are comforting. Both the large mills in that town are running, business is flourishing and times lively. We have no late advices from the Sheep Ranch district. Calaveras will produce more quartz gold, the present season, than ever before.

EL DORADO COUNTY.

Placerville *Democrat*, Feb. 27th: We understand that a gravel deposit has been struck in Castle Hill about two miles east of Georgetown, which prospects well. There was a great deal of labor and money spent in prospecting this hill, in '54 and '55, but nothing of account was then found. Our informant tells us that two companies have now struck it, and from present indications, the deposit is quite extensive.

March 6th: The syenitic hills on the northern bank of Webber Creek, in the vicinity of Cold Springs and Gold Hill, are traversed by belts of dioritic porphyry, carrying narrow veins of auriferous quartz. These veins can be divided into two classes; those which contain native gold only, and those in which the gold is combined with various minerals. But little has been done towards developing the former; some indeed, as the American lead and the Grey Eagle, have yielded good quartz from the very surface, and one at least, the Columbus, has at one time been famous for its uncommon richness; but none, so far, has heen opened at a greater depth than about 40 to 60 ft. Among the veins belonging to the latter class, the most important occur a short distance from the line of junction of the granite and slate. On this vein two companies have made locations: Schleicher & Co., who have done just work enough to hold their claim and ascertain the presence of good ore; and the Hill Lead Mining Co., who have put up steam hoisting works as well as a 4-stamp battery, and sunk a shaft about 100 ft. deep. In the Hill Lead mine the width of the vein varies from 2 to 18 inches and will average one foot. The gangue matter consists essentially of quartz, diorite and carbonate of limo, with some carbonate of manganese. The ore is remarkable for its complexity. Native gold, which was abundant near the surface, soon disappeared, and now occurs as an exception only. The gold is found combined with iron pyrites and tellurium, while a great variety of minerals, as copper pyrites, galena, telluret of iron, etc., are accidentally met with in varying proportion. The ore, although rebellious, is rich; the first class paying not less than $200 per ton.

It is rumored that the U. S. Grant mine, on Brush Creek, has been sold to some Eastern parties. Parties have already negotiated for machinery to place on the mine, and have agreed to have the same completed within three months. The mine has been prospected to the depth of 59 ft., the rock from which worked in an arastra, yielded $30 per ton.

The Silicon mine, on Smith's Flat, has been sold to parties in San Francisco, who have made several shipments of the rock, recently, to the Bay.

A Frenchman and a German have discovered an exceedingly rich vein of gold-bearing quartz up at American Camp. The specimens they brought down to the city to day are very rich. It is somewhere near the U. S. Grant and the Star veins.

It is rumored that Andrew Roeco has bought the interest of Irwin Davis, in the Golden Rock Water Ditch.

KERN COUNTY.

Havilah *Courier*, March 2d: The well known McKeadney mill, has been clattering away since Thursday.

La Esperanza claim, in Kelsoe Valley, about five miles south of Sageland, worked by Birdseye, Carter and others, is turning out well. They have a 5-stamp battery, and last week retorted 138 ozs. after a run of 13 days. The claim promises to continue profitable.

MARIPOSA COUNTY.

Gazette, March 5th: It is reported that the Crown Lead Mining Co., near Coulterville, will commence operations again soon. At present the company are engaged in repairing roads and preparing to raise quartz, etc., for the purpose of getting this mining property under full operation.

The Washington quartz mill, situated near Hornitos, crushed, week before last, 40 tons of rock which yielded $1,400—for six days' run.

NEVADA COUNTY.

Transcript, March 2d: The North Bloomfield Gravel Mining Co. have located that portion of Cañon Creek, from a point below the Jefferson Quartz Mill to Bowman's ranch. The creek is located for the purpose of diverting the waters of said creek for mining purposes. The claim includes all the waters of the creek, and its tributaries above Jefferson mill.

Andrew & Co. have located and claim 1,500 feet on the extension of the West Idaho ledge, situated between Deer Creek and Slate Creek, in Grass Valley township.

March 5th: For some months past cement mining in Little York township has heen rather dull, but during all the time the claims of Brown Bros., near You Bet, havo heen yielding handsomely, and they are now turning out more dust than ever before. Taking into consideration the difference in cost of working, these claims beat White Pine.

During the past three weeks the Brown Bros. have taken out in the neighborhood of $17,000, the claims averaging over $6,000 per week. The last run of two and a half days yielded $2,700. The mill has since then heen stopped for repairs in the batteries, and will he ready to start up again on Monday next.

Neece and West, at Brown's Hill, near You Bet, have commenced work in their claims, after heing idle for six months, and they struck the channel last week, where they found excellent prospects. Some three years ago these parties opened upon a basin or hole which was then supposed to he the channel, and they took out a large amount of money, after which they ran out of pay, and pushed their tunnel ahead supposing that the channel went through the hill in a direct line to the Brown Bros. claims. Since they again commenced work the channel has been found, and it is ascertained that it takes a sharp bend around the hill, and that the hole or basin from which they got such good pay was formed by the short turn and eddy in the old river bed. They are now breasting out in the true channel, for the purpose of getting the cement ready for milling.

Gazette, March 2d: The Grass Valley correspondent writes: Among the new enterprises which promise success, I notice the Garden City mine, located above the old Gold Hill mill on Wolf Creek, and owned by a San Francisco Co. The ledge in this mine is about two feet in thickness, with beautiful walls, and shows some gold with heavy sulphurets. The miners are now engaged in raising the incline shaft to the surface. Gregory & Mansau, at Sebastopol Hill, are taking out some splendid rock, which good judges say will pay as high as $75 per ton. The ledge is not a very large one as yet, but has improved as the miners go down on it.

The "Young Pines" Co. think they have a good ledge, as it is an extension of the Wm. Penn Co's lead. Work will be resumed on the Young Pines claims sometime in the summer.

There has been but little said about the U. S. Grant, the Seven-Thirty, the Bowery or the Bay State ledge lately, because no crushings have heen made from either of them, on account of the roads heing too soft for hauling rock to the mills. All of these mines have lots of good looking ore on the surface, and will be enabled to crush within a week or two.

March 5th: A flume is now being constructed hy Leavitt & Co. from Deer creek, up Kelsey's ravine, to connect with the old flume across Pine and Commercial streets.

March 6th: Work is soon to be resumed on the Allison Ranch mine. One-half of the mine has been purchased by Erwin Davis.

Grass Valley *Union*, March 5th: Philip Day has started a quartz mill at Rough & Ready and is running it night and day on very satisfactory rock. His company is running into Bunker Hill, and it is thought that good rock will come out of the hill. The Rough & Ready mill has a battery of three stamps and an arasta.

Lndington & Co., hauled some rock from Grass Valley to the Rough & Ready mill and received a return of $40 per ton.

March 7th: Gregory & Mansau, of Sabastopol Hill, have had a crushing. Thirty tons of their rock yielded them the sum of $2,500. The ledge, as they go down on it, is improving in thickness as well as in appearance.

In the upper part of the county, about Graniteville, the miners are preparing for a brisk summers' work. A gentleman just from Eureka informs us that the snow is rapidly melting; only about two feet remaining now on the ground. Some of the opened mines have not stopped work during the winter, and when the snow goes off many new ledges will be prospected.

The gravel mines of Underwood & Co., near Union Hill have lately been paying very handsomely. The scarcity of water during the winter prevented work upon these claims, but now from $12 to $15 per day to the hand are realized.

Grass Valley *National*, March 5th: Luddington & Co., recently struck a stringer of this ledge, which is situated in Rhode Island Ravine, and took out three loads of rock from which they realized $125. The rock was crushed at the mill of Philip Day, at Rough & Ready.

March 6th: We saw last night at Findley's hank a bowlfull of gold worth over $2,500, the yield of 30 tons of rock from the ledge of Gregory & Co., near Osborne Hill.

Transcript, March 7th: The blue gravel mines, at Smartsville, are among the most valuable in the State, and the ground is held by three companies as follows: The Blue Gravel Mining Co., the Blue Point Mining Co., and the Smartsville Consolidated Hydraulic Co. For the past three or four years these companies have been engaged in litigation about their respective boundary lines, but all matters of dispute are finally settled, and the three companies have gone to work in earnest upon enterprises of great magnitude.

The Blue Gravel Co. have started upon their deep bed rock tunnel. They have been at work on this tunnel one year and expect to reach the channel in two more, when they will have a face 60 feet deeper than the claim has yet been worked. The Blue Point Co. have been running their tunnel three years, and expect to finish it in a year and a half. They have raised two shafts and are now working upon the tunnel in five places, to strike the channel at about the same depth as the Blue Gravel company.

The Smartsville Consolidated are washing off the top level, and have ground enough to last three or four years without running a bed rock tunnel.

From the channel at this point immense sums of money have heen taken out and the owners have become rich. When they are opened to the new levels the claims will be more valuable than ever before.

Grass Valley *National*, March 8th: John Calbert & Co. have located 900 feet on the Uncle John Co., commencing at the residence of John Calbert, on Missouri Hill, and running north 400 feet to Kelly's house and south 500 feet to the Allison Ranch stable.

The Hartory mine has been leased to a Company of about 25 men. The mine has been pumped out and work was commenced to-day taking out rock.

Work was resumed this morning on the Wisconsin mine. For a year or two, Dennis O'Keefe and others have been hard at work running a bed rock tunnel, above Nevada, in order to strike a gravel range. They were about giving up in despair, when last week they finally struck it rich. The gravel prospects from 25 cents to $3.75 to the pan, and from four car-loads they took out $67.

Frank Morse started the stamps at work this morning at his mill. He has a large quantity of good looking rock on hand, and the stamps will he kept busy.

Leavitt & Co. have been sluice mining for several days past in the ravine between Main and Broad streets. The same ground was worked over 19 or 20 years ago.

Gazette, March 5th: We noticed a fine specimen of copper ore at the Union Hotel, weighing about sixty pounds. It was recently brought up from the Well lead, near Spenceville. It is estimated to contain from 12 to 15 per cent. of copper.

PLACER COUNTY.

Auburn *Stars and Stripes*, March 4th: We are informed that a sale of one-fourth interest in the mine known as the Paragon, has just been made for $25,000. The claim is divided into four shares, and has paid in dividends within the last three years over $30,000 to the share. The tunnel is now 3,000 feet into the hill, and no signs of the claim paying less than heretofore.

SOLANO COUNTY.

The Vallejo *Recorder* has been shown specimens of cinnabar taken from the mine owned by John Brownlie, near that city, which, for richness, equals anything to be found in the New Almaden. The extent of the mine is not known.

SISKIYOU COUNTY.

Yreka *Union*, Feb. 27th: After giving a general history of quartz mining on Humbug Creek, the editor says: The Eliza and Accidental are both of good width and will supply an abundance of quartz. In the Knapp ledge the quartz is not so abundant, but is of better quality, yielding an average of $50 to the ton. Lash & Co. having prospected the Eliza and Accidental sufficiently to satisfy themselves of the quality and quantity of the quartz, intend to push operations on them with vigor, and we may confidently expect as the result,

an important addition to our gold yield from this source. During the past three or four years there has been also a San Francisco company operating on the Middle Fork. In 1865 they erected an arastra, driven by water-power, and have prospected their ledge very thoroughly, and are, we understand, perfectly satisfied with the result. More than a year ago they bought a mill to be erected on the claim, but owing to some want of harmony among the members of the company, the mill has never been shipped from San Francisco, and no work has been done on the ledge since. During the past few years still other parties have prospected considerably with more or less satisfactory results. A. M. Jones has erected an arastra at the Forks, with which he has been crushing rock obtained from up near the base of "Old Craggy." How much per ton his rock yields we have not been able to learn.

TUOLUMNE COUNTY.

Sonora *Democrat*, March 6th: Ryland & Parsons, of Kincaid's Flat, are doing well in the old Dobbinspeck ranch, mining it up. The claim is 15 feet deep, and will last 20 years. It pays from $5 to $6 per day to the hand. Five men are employed.

Knox & Boyle are building a fine 10-stamp mill at the foot of their claim, in Quartz Mountain. It will be completed about the 15th of April. They have two tunnels running into the mountain; one is about 400 feet, the other about 200, and are being pushed forward as fast as possible. This tunnel is 50 feet lower than the upper one. The rock averages $40 per ton. They have out now some 30 tons, and are still getting out more. When they get their mill in operation they will take out large sums of gold.

Heslep's claim, adjoining, is paying very well. Mr. H. wants to purchase a larger mill, his old rickety 8-stamp mill don't suit him.

App's claim, adjoining Heslep's, is also paying remarkably well. This claim has always been considered the best in the county. The mill, a 10-stamp one, is located on Wood's Creek, one mile from the claim. Mr. App intends to build a new mill upon the claim next fall. He has two engines in his mine hoisting rock and water. A tunnel pierces the mountain some 600 feet. The shaft from surface, is 350 feet deep, and from level of the tunnel 250 feet. The rock averages $14 per ton. Eight tons per day is crushed.

D. Kelly, of this city, has half a ton of rock from his vein on Fox Gulch, that is very rich. Streaks of gold run through every inch of the rock; it will pay $2,000 per ton. He has sunk a shaft some 60 feet deep. Mr. K. will send this half ton of rich rock to San Francisco, to have crushed.

Mr. Stage, Superintendent of the U. S. Grant vein, near American Camp, is pushing forward the completion of the mill and and hoisting works. Some 20 men are employed at present in the mine and building the mill.

J. B. Hiskey, of the Star mine, near the U. S. Grant, says that his company will soon start in again and get out rock. They have been running a tunnel for the past eight months, which will strike the vein some 400 feet lower than the old tunnel.

A party of gentlemen went down to La Grange, Stanislaus County, last Friday, to make arrangements about cutting a ditch to take water from their Columbia ditch into that place.

YUBA COUNTY.

Marysville *Appeal*, March 4th: We understand that the Pennsylvania mine is crushing fair rock, and that its future prospects were never more flattering. Owing to the depth of the main shaft the claim is troubled with water, and we understand that the Trustees have ordered a 12-inch pump, at an expense of $3,000.

E. Halphen, an old resident of Brown's Valley, called upon us yesterday and exhibited specimens of very rich quartz from the Howard Hill Mining Co., a mine located on Union Hill, two and a half miles south of Grass Valley. There is a 15-stamp mill crushing on this claim, and judging by the rock shown us the proprietors have a bright prospect for a fortune.

ARIZONA.

Prescott *Miner*, Feb. 20th: The White Picacho mine, near Wickenburg, in this county, is looming into importance. According to tests recently made of the ore, by Reese & Krause, of Wickenburg, for B. Hussey and P. Richardson, who design working the mine, it yields as follows to the ton:

By Fire Assay—gold, $87.20; silver, $18.95; total, $106.23. When smelted, it produced, lead 25 per cent.; silver, $16.90; gold, $78.28.

Prof. Hodges, of Boston, recently paid a visit to the Sacramento mining district, and was well pleased with the prospects.

BRITISH COLUMBIA.

The total export of coal from Nanaimo, British Columbia, during the months of January and February last, amounted to 3,834 tons.

IDAHO.

Boise *Democrat*, Feb. 20th: The Rising Star Mining Co's property, in Flint District, has been attached at the instance of Thomas Cole Jr. & Co., for about $54,000. This is but the result of mismanagement, as the mine has been paying very fairly.

The news from the Golden Chariot mine continues favorable. For the last eleven days they have run out an average of 15 tons per day, making an aggregate of 165 tons.

A correspondent of the Helena *Gazette* writes from Leesburg that the snow is about 18 inches deep in the basin, and from three to four feet on the divide between Leesburg and Salmon City. The citizens have quartz on the brain, growing out of the discovery of two ledges on Arnet's Creek, seven miles from Leesburg. James G. Viar discovered the Eureka, which is rich in fine gold. The other is called the Musgrove lodge, half a mile below the Eureka, and is also very rich in gold. Work is going on vigorously on these ledges.

MONTANA.

Helena *Post*, Feb. 19th: J. T. Harvey who has just returned from the Missoula mills, informs us that he is at work running a drift into the White Cloud lode, 16 miles from Fort Owen, and taking from it a species of decomposed quartz, which, run through arastras, yields very richly.

The Whitlatch Co. which suspended work last summer, have again resumed most active operations upon that mine at Unionville. A large force of miners have commenced cleaning out the shafts on the lead and getting everything in readiness for taking out rock in large quantities. It is the purpose of the company to have a mill at work upon this lead as soon as one can be erected.

We learn that the prospects of the Lindsey Mining Co. improve as the work progresses. For the last week two shifts of miners have been constantly at work on the shaft, which has been sunk to the depth of about 29 ft. It is calculated from the indications of the gravel in which they are now working, that they will strike bedrock in about six more feet, which will consume the greater part of this week. The water which accumulates in the shaft has decreased in volume, and at the present time, during stoppage of the pumps, the water reaches a point a foot below former water marks.

The splendid tunnel which has been in progress during the past winter, for the purpose of striking the McClellan lode, has at last struck it after running 200 ft., and is being run through the quartz comprising the ledge. There is no doubt but that this is one of the richest lodes in the country. A mill is all ready to be put up upon this lead, and will be erected the moment the season will permit.

The Virginia *Democrat* says: Morris' Creek, situated a few miles from Rochester, in Deer Lodge County, is being rapidly developed. The lodes of the district are silver producing, and are said to be very rich. It is said that a large number of the owners of lodes are at work upon their property with the greatest hopes of success.

A new lead has been discovered at Sterling which is said to be richer than anything ever before discovered in that section.

NEVADA.

HUMBOLDT.

Unionville *Register*, Feb. 27th: The Alpha mine, situated in Butte cañon, on the west side of the Humboldt range, about six miles from Unionville and three from the Central Pacific Railroad, ranks high among the first-class mines of this State. The vein is at present 12 feet wide in the shaft, now 130 feet deep. A tunnel is being run on the vein, following its course, and will intersect the shaft at a depth from the surface of 220 feet. The vein in the tunnel is 13 feet wide and the ore of a superior quality. Arrangements are being made by the owners to ship the ore by railroad to the Desert mill, at the lower or west side of Humboldt Lake. A graded road to facilitate hauling ore is almost completed to the railroad switch.

Mr. Smart, who returned from Elko a few days ago, informs us that Frank Dorman is shipping ore, by railroad, to the Truckee, from a mine in Panther cañon.

The mines in Gold Run district continue to "pan out" regularly. T. G. Negus shipped from the Golconda mine in that district, on the 21st instant, by the Pacific Union Express, two bars of bullion, valued at $1,500; and Holt & Elzy one bar valued at $800.

REESE RIVER.

Austin *Reveille*, March 4th: Arrangements are now in progress, and there is every reason to believe will soon be completed, by which the fine and extensive property of the United Reese River Mining Co., will be work systematically and extensively. The company own a large number of veins in this district, which they have allowed to remain idle up to the present time.

Belmont *Champion*, Feb. 27th: A correspondent, writing from Hot Creek, after alluding to the White Pine exodus, says: But the most of us are remaining on the merits of the district as a mining camp, knowing as we old residents well do, that we have many a ledge in the foothills, as well as immensely rich chimneys or pockets on our limestone mountains, many of which, I have no doubt, will prove permanent veins. We have one positive mine in particular, the locators of which, owing to financial difficulties, have been obliged to suspend work for the last two or three months—a fine chance for capital to step in and get a valuable piece of mining property at a comparatively low figure. There are many claims partly developed which could be bought cheap for cash, that would return to capital the fattest of dividends. Van Gillet has located and opened a new vein of some 20 inches in thickness, which bids fair to rival the best. This district, so far, has been unfortunate. Capital has done nothing for us; the companies that have been represented here, it is well known, have kept their money at home—apparently expecting to open mines without disbursements. Whenever we have live capital invested, with efficient management then will our section render up its hidden treasures to the satisfaction of all parties interested.

The Montezuma mill, better known as Dean's mill, situated in the lower part of Belmont Cañon, is daily hammering away on ore from the Galvin mine, situated on Arizona Hill, with fine results. This mill, with a capacity of four stamps of 180 lbs. each, is doing bravely for one of its size.

During the past week there was shipped by the Belmont Silver Mining Co. to the First National Bank of Austin five bars of bullion, weighing 355 lbs., valued at $4,214.85.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Virginia *Enterprise*, March 2d: Yesterday morning the lower tunnel of the Occidental tapped a vein of about 15 inches of water. The tunnel is being run on the west side of the lead and the water comes in at the bottom and from the east side of the tunnel. The striking of this water is considered a very favorable indication.

The Bacon Mill, Silver City, started up last evening on Hale & Norcross ore. The mill contains 20 stamps, eight Wheeler, eight Knox and two Hepburn pans, and is capable of working 40 tons of ore per day.

The Alpha Co. yesterday struck a small vein of very fine ore in drifting toward their ledge. The vein found is on the west side of the main lead, It is expected that the main vein and good ore will be reached in about six days.

The Ione mill, Lower Gold Hill, has recently been purchased by the proprietors of the Twin mine, Silver City, who will start the same into operation to-day or tomorrow on ore from their mine.

The experts are looking for ore in the Imperial in about ten days.

March 3d: Wells, Fargo & Co. shipped from their Gold Hill office during the month of February, bullion amounting to $229,251 55.

March 4th: Some excellent ore has been found in the west vein of the Justice and Independent mine at the 260-foot level. Assays running as high as $300 have been obtained from it. The old caved drift at the 350-foot level has been cleared out and retimbered. It was found to run northward from the shaft a distance of 150 feet. At the north end some very promising ore has been found. The lead at this point is said to very much resemble the Comstock in the lower level of the Hale & Norcross.

The Sierra Nevada mill is running to its full capacity (20 stamps) on ore from the company's mine. Of late they have found a deposit of ore much superior to that which they have been crushing during the time this mill has been in operation.

A dispatch dated Virginia City, March 4th, says Wells, Fargo & Co. shipped, last night, 39 bars of bullion, weighing 2,760 pounds, and valued at $73,233.59.

Much anxiety is felt over the result of operations in the Hale & Norcross, and strong hopes are entertained that a good body of ore will be struck soon, in the lower level.

WHITE PINE.

Our exchanges from this district have not come to hand this week, yet we believe that nothing of a startling character, further than has already been published, has been developed, and indeed we cannot expect any new and reliable information until the ground has been cleared of snow and a chance has been given to more thoroughly prospect and develop the mines, which, according to some, will be within a month, but others postpone the bright day until the month of June.

Virginia *Enterprise*, March 3d: Many persons are still leaving this part of the State for White Pine. The pleasant weather which has of late prevailed, has kept the fever raging, when it would otherwise have subsided till spring. Most of those leaving at present, are going out on "general principles." Having neither mines or town lots in the new region—they expect to make fortunes in some way at present unknown to themselves and everybody else

The Robinson district, some 30 miles east of White Pine, is said to contain some very large and valuable leads. A party of gentlemen interested in the district leave this city to-day to look after locations made for them there. The assays of the principal leads discovered run from $80 to $275. There is said to be plenty of wood and water in the district, and the country rock is similar to that at White Pine, being limestone and granite.

Austin *Reveille*, Feb. 27th: We were informed to-day that bullion amounting to $30,421 99, was shipped by the agency of the First National Bank of Nevada, at Treasure City, White Pine, to Elko and thence overland to New York city, on the 24th and 25th instant.

March 1st: The stage from White Pine, which arrived here this morning, brought eight bars of bullion, weighing 673 pounds, which were consigned to the Bank of California and forwarded by Wells, Fargo & Co's Express.

UTAH.

Salt Lake *Reporter*, March 3d: We have been shown by a gentleman an assay of ore from a mine within 40 miles of Salt Lake City, which has heretofore been worked merely for lead and silver. The assay was made at the office of Rein, Heunire & Co., San Francisco, with the following results: 18.20 oz. of silver, at $1.30 per oz., $23.69; 48.60 oz. of gold at $20.67 per oz., $1,004.51. 66.82 oz. per ton of 2,000 pounds, rating at $1,026.25.

JAPAN.—The editor of the Virginia *Enterprise* has been shown a letter from Yokohama, Japan, from which the following extracts are taken: I am convinced that these islands contain as rich gold and silver mines as any in the world. The heretofore exclusive policy of the Government has prevented the proper development of the mines—besides, the people until now entertained the opinion that it was criminal to extract more ore than was required for immediate and necessary use, and that a great sin would be committed in case no ore was left for future generations. Oh, for a dozen or so Washoe prospectors! Yet there are some Japanese, not having the fear of their gods before them, who have smuggled to this place enough gold and silver ore to fill 13 large warehouses. Different and more liberal ideas are now prevailing with the party at present in power. The rebellion between the Northern and Southern parties still continues. The party now in power is entitled to the ownership of the mines, and being in need of money to carry on the war, has for the first time invited foreign miners to act as superintendents, on large salaries, in order to extract as much bullion as possible in a short space of time.

THIRTEEN AND A HALF CENTURIES AGO.—A curious discovery, kept secret for fourteen years, has just come to light at Ravenna. The workmen engaged in digging a canal near the present railroad station, in 1854, found a skeleton with a breastplate of fine gold buried face downward. The precious piece of armor, which weighed six pounds, was broken up and the pieces secretly sold to jewelers. Two larger pieces, which appear to have been the shoulder bands, and are covered with chasing and enamel, have been given up by a jeweler in Faenza, but the remainders are probably lost. It is known that Theodoric buried the body of Odoacer, after his murder at Ravenna, face downward; and the Italian antiquarians suppose that this golden harness is really that of the first King of Italy. The conquest of Italy by Theodoric, the Goth, took place about the year 500.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
ISAAC G. STREET, Oregon.

Resident Agents.

OAKLAND.—W. B. Hardy.
A. S. Hopkins, No. 70 J street, Sacramento.
WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, March 13, 1869.

Notices to Correspondents.

WASHOE.—Water can penetrate not only through fissures, crevices, and planes of stratification, but also through the mass of rocks. It is necessary to distinguish the penetration of water through capillary interstices between crystalliue or amorpbous minerals and rocky matrices, from actual penetration into miuerals themselves. The larger the last named are, for example coarse-grained granites, syenites, trachytes, conglomerates, etc., the more readily does water penetrate into their capillary interstices. Very fine-grained sedimentary rocks, similar to those known as elay slates, are readily permeated with water in the direction of the planes of stratification, but witb great difficulty in a direction at right angles to such planes. Water when absorbed by crystalline minerals follows the direction of tbe cleavage planes. In shafts and mines it can readily be seen whether a rock is readily penetrable by water or not. The greater the obstacles presented by water in mining operations, the greater the penetrability of tbe strata to aqneous influences may be inferred. In agate quarries in the Amygdaloid rocks of Oberstein, the roof is always wet, water dropping from all parts. A quick and tolerably simple method of determining the greater or less porosity of rock, is to place it in very dilute sulphuric acid in the vacuum of an air-pump. By this means, the air in the pores of the rock is removed, and on the restoration of the atmospheric pressure, the vacaut pores are refilled by the acid. If the piece experimented on be now broken and washed, the presence of acid may be tested by litmus paper.

CALABRIA.—"Apennine," as applied to the monntain chain that traverses Italy, with many spurs diverging from it both in easterly and westerly directions, is derived neither from the Greek nor Latin languages, but from a much more ancient one, the Celtic, which language, at a remote period, pervaded Enrope, and probably Asia also. "Alp" and "Pen," in the Celtic language, both mean high, or lofty. It has generally been asserted that the word Albion bas its derivation from the Latin word *album*, white, from the white chalk cliffs of the soutbern coast of Britain. The probability is asserted that Albion may be derived from tbe word Alp, or high, as additional examples of which may be mentioned the Clan Alpin, of Scott's Lady of the Lake, and the Alpeens or long sticks of the Kilkeuny, Tipperary and Waterford boys, which they know well how to use in a "scrimmage—alpeeus being longer than a cudgel, shillelagh or walking-stick. The Alpenstock of Swiss guides and mountain climbers is derived from the same root as the term alps itself. Pen, for a mountain, is generally used in Wales as Penmanmaur, and in Cornwall, Penrose, Pendonnis, Penzauce, and a long list of pens could be adduced. In Scotand, Pen has been changed into Ben, as Ben Lomond, Ben More, Ben Cruachan, Ben Lawun, Ben Nevis, Ben Mac Dhui, etc.

Strength and Economy of Hydraulic Pipe.

Amongst the important new developments that have been made in mining since the era of the discovery of gold on the Pacific coast, some engineering questions involved in hydraulic mining are interesting, and worthy of a much more special attention than has been paid to tbem. Of the greatest, and most geueral importance to miners and engineers, are the data that have grown out of trial and practice in the use of iron hydraulic pipes, touching their dimensions, weight, streugth and cost. At the same time we may mention, in this connection, that there are other engineering problems of very great practical and economical importance to gravel miners, which are only partially developed, or but locally applicable, and whieh have not been duly cousidered in publieations on the subjcct.

In the construction of iron pipe, orders are usually given to one or another of the fonudries in this city, for plate or sheet iron pipes to contain a certain volume of water, at a certain head, under conditious of slope and distance applying to the particular mine in which the orderiug party is interested. As the price is in proportion to the amount of metal used, miners have not been slow in discovering the limits between the greatest practicable reduction in weight and strengtb, and the economy and durability of pipe under specified heads of pressure; and colossal experiments were thus inaugurated and carried quietly to a successful issue, by persons generally who interested themselves not in the least in the capacity of sheet iron pipe to resist pressure, further than that it concerned the production of gold in their particular mine.

Amongst the foundrymen in this city certain rules have heen establisbed on this subject, which may be accepted as the law, being generally followed by miners in ordering hydraulic pipe. The best approximation that we are able at present to make to a rule of this kind is that, in the case of 11-inch pipe, for example, one-sixteenth inch iron, (called "No. 16 iron",)—withstanding half a pound of pressure to the square inch for each foot in hight—will bear a head of 250 feet perpendicular. Were the pipe inclined along the surface of a bank a slight variation due to friction would admit of increased head with safety. The pressure on the pipe laterally will in every case be equivalent to that which wonld give to the water a certain velocity.

In figuring it down to the "lowest notcb," and taking the chances in thin pipe, we might mention a number of hydraulic miners whose experiences would be worth noting. Mr. W. D. Clark, a ditch owner at Railroad Flat in Calaveras County, some years ago purchased at 40 to 50 cents per foot, or less, large lots of corrugated iron intended for bouses, and unsalable for tbat purpose at the time in the market, the same being 1-20th and 1-24th of an inch in thickness; rolled it out, and constructed pipe seven inches in diameter, which stood a pressure of 250 feet perpendicular. Mr. Chabot, of the Oakland Water Works, has also made and brought into use a considerable quantity of very light pipe.

But the most exteusive, systematic and thorough tests yet made of the strengtb of thin pipe material under a great head, took place about a year ago in connection with the water supply of this city under the auspices of the Spring Valley Water Co.; Messrs. Moore and Cummings, of the Risdon Iron Works, having the matter specially in charge. The results arrived at were immediately put into practice in the construction and laying of the 30-inch pipe which is now supplying tbis city with water—a length of seven miles. The greatest pressure at any poiut in that distauce is 300 feet perpendicular, and the iron made use of there, in accordance with the tests previously made, is No. 9, or one-ninth inch cast iron. At a great many places there is a pressure of near 200 feet, at which either No. 9 or No. 11 irou is used. No. 11 iron is used to withstand the pressure at 100 feet head, and No. 14 at 60 feet. The latter, bowever, withstood, in the tests that were made, a pressure of 140 pounds to tbe square inch, equal to about 300 feet head; the tests being made in the yard of the Risdon Works with an ordinary hydraulic apparatus, and allowed for at the rate of one pound to two and three-tenths feet head.

In hydraulic mining the most common description of pipe is from 12 to 14 inches in diameter, and of No. 14 iron (1-14th of an inch in thickness) the same withstanding from 100 to 300 feet head; the highest pressure in use that we are aware of, being 400 feet, though we are unable to state what weight of iron was used in that case.

Recently wrought iron pipes have been brought into use to some extent in the Spriug Valley Water conduits. It is estimated that one-sixteenth inch wrought iron pipe affords the same resisting power as a $\frac{3}{8}$ inch of cast iron material, or that the former is six times the strength of the latter. But as wrought irou costs much more than cast iron for the same weight, the point bas not beeu proven, thus far, that wrought irou is any cheaper than cast iron. Some tabular data on this subject are found in "Molseworth's Mechanics Companion."

Back Again.

It is with pleasure that the senior Editor once more greets the readers of the PRESS, after an absence of some six months in the Atlantic States. The fact that the trip was undertaken for the benefit of his health, which had become seriously impaired from long continued editorial labors, is his only apology for silence during so long an abseuce. Had circumstances been different, it would have given him much pleasure to have drawn from his notes of travel many facts which would doubtless have proved interesting and possibly instructive to our readers. It is with much pleasure, however, that we are able to refer with confidence to the satisfactory manner in which the editorial chair has been filled during our absence, and our readers will doubtless share witb us in the additional satisfaction that they are not, for the present at least, to be deprived of the pleasure and instructiou to be derived from the facile and ahle pen of our late *pro tem.*

At no former period in the history of industrial progress, has there been so much apparent need, or so marked a desire for the acquirement of practical knowledge as is witnessed at the present day; and in no department of kuowledge is this necessity so strongly felt as in those branches involving tbe application of chemistry to the arts and sciences, and to industry. The oue most important industrial specialty to residents on this coast, is that of metallurgy. This is one, the general importance of which, has recently stimulated to a high degree the minds of scholars and thinkers of all countries, and the result has been large additions to our stock of metallurgical knowledge, and greatly increased facilities for pushing difficult metallurgical operations to more successful and economical issues.

Nothwithstanding the important progress already made, we bave good reason to hope, in the immediate future, even more than has been accomplished in the recent past. Fully impressed with this opinion, we shall endeavor to make the MINING AND SCIENTIFIC PRESS in future, a still better exponent of progress in this direction.

The difficulties involved in many of the questions now brought forward in connection with mining and metallurgical operations seem to require, in carrying out the above idea, that we should associate upon our editorial staff one who, by recent personal inspection and foreign study, has become thoroughly informed with regard to tbe latest advances in this direction in European practice and in the European schools. To this end we have secured the continued advantage of the assistance above alluded to. With such assistance, added to our numerous valuable scientific contributors, we have no hesitation in promising that we shall hereafter be able to make the PRESS of far more practical value than heretofore—that we shall be able to keep our readers fully posted in every important industrial improvement, and bring tbem into direct and easy acquaintance with the most advanced truths of science.

The Paris Exposition Reports.

It will no doubt be a matter of cousiderable interest to most of our readers to learn that active measures are in progress to spread before the public a full and comprehensive report of the late Paris Universal Exposition. The work necessarily attendant upon the production of such a report, is much greater than would be supposed by persons unacquainted with labors of this kind; in fact, in this instance, it has greatly exceeded the anticipations of the Commission which was appointed for its accomplishment.

The special reports from the different commissioners have all, we believe, been some time since handed in to the Secretary of State; but it has been found necessary in order to obtain from such a diversity of material and writers, a unity of expression and purpose, to submit the whole mass to the supervising eye of one individual. Our California readers will doubtless be pleased to learn that this supervising labor has been intrusted to the Commissioner from this State—Professor William P. Blake. This labor was undertaken at the request of the State Department, and is now in a most satisfactory state of forwardness.

The reports cover a wide range of subjects, some of them constituting exhaustive treatises upon their respective branches of industry. The prominent authors are: Professor Barnard, of Columbia College; Professor Morse, Professor J. Lawrence Smith, of Louisville, Ky.; Commissioner General N. M. Beckwith, Mr. A. S. Hewitt, C. B. Norton, of New York, and Mr. E. R. Mudge, of Mass. Professor Blake, of this State, is the author of one of the most important of these reports—that on the Precious Metals, which is extended to a volume of nearly 400 pages.

The series of reports is prefaced with a "General Survey of the Exhibition; with a report on the Character and Condition of the United States Section." This volume has been prepared by a special committee, consisting of Messrs. Seymour, Evans, and Aubincloss, assisted by Commissioner Beckwith and Professor Blake. The entire series, with the accompanying illustrations, will form five or six large volumes of from five to six hundred pages each. About fifteen hundred pages were already through the press, but not yet bound, at the time of our visit to Washington, the last week in January, and comprised the following special reports:

The "General Survey of the Exhibition," already alluded to; Report on the Precious Metals, by Professor Blake; the Production of Iron and Steel, by A. S. Hewitt; Wool and Manufactures of Wool, by E. R. Mudge; Munitions of War, by C. B. Norton and W. J. Valentine; Silk and Silk Manufactures, by E. C. Cowdin; on the Fabricatiou and Use of Béton-Coignet (artificial stone), by L. F. Beckwith; on the Fine Arts, by Frank Leslie; on Instruments and Apparatus of Medicine, by T. W. Evans. These pages, a set of which was kindly placed in our possession, constitute about one-half of the entire series. They are beautifully printed, on very superior paper; while the style of execution and the arrangement of the details of the pub-

lication reflect the highest credit upon the Editor, Professor Blake, and the Congressional printing office.

These reports do not present the usual slovenly and cheap appearance, which is observed in ordinary public documents. They are printed on new type, with profuse and well-executed illustrations; and it is gratifying to find in their appearance, that public documents can be made to assume an interesting dress. It is in every way fitting that this official report of one of the most important industrial events of the 19th century, should thus be presented to the country and to the world, in a manner and form every way worthy of careful study and permanent preservation.

Dry Barrel Amalgamation.

Reference was made in our last issue to a dry barrel amalgamation process which, we stated, had been under experimental and working test at the Miners' Foundry during several months past, in the hands of the inventor, Mr. Almaria B. Paul.

Previous to the extended series of experiments above referred to, this process has been in operation for some time at the Kearsarge mill, in Inyo County, where it seems to have originated. Mr. Paul's claims in favor of the success, and of the great value of this process, are sufficiently definite, and sustained by assays and documentary testimony, to enable us to present a tangible statement in regard to it for the information of metallurgists, so far as the results are concerned. A patent having been applied for, and the papers not yet returned, we are restricted to an outward description; the chemical reagents used in connection with the dry ore and quicksilver in the revolving iron barrel being for the present withheld. But as the inventor himself does not pretend to explain the chemical action in its details—claiming only that the results are remarkably favorable, and that friction electricity has something to do with the matter—it may be as well to ignore theory for the present, and to attempt merely to state the facts.

The patent is named the "Paul & Wood Electric Process," the patentees being A. B. Paul, the introducer of the present Washoe pan process, and I. L. Wood. We have taken from Mr. Paul's statement the following notes: The process was first brought into practical operation six months ago on the base silver ores of Kearsage District, and has been at work privately in this city for four months. It embodies in its results, says Mr. Paul, the Patio, Freiberg barrel, and Washoe pan processes. Its remarkable feature is that all ores containing lead, copper, antimony, and iron with the precious metals, may be cheaply and successfully amalgamated, and in such a manner that only gold and silver are taken up by the mercury. The latter point is claimed to be substantiated beyond all question. California gold ores are said to yield their metals at a percentage never before attained in any other manner. The machinery consists of a plain hollow iron barrel, set in brickwork, so as to revolve over a fire bed. The ore is very thoroughly pulverized and introduced dry, with certain chemicals not specified; the barrel is set revolving and at the same time the fire is kindled, heating up the ore to a degree such as certainly to expel all atmospheric dampness. The effect of this, according to the inventor, is to create electrical conditions in the ore which, in some way unexplained, operate advantageously. The evidence of the existence of such electrical condition does not appear to be anything more positive than that the ore clings to the periphery of the iron cylinder, and has the appearance of a body of magnetic particles clinging to a magnet. Mercury is now introduced, and the fire withdrawn; as the barrel revolves amalgamation goes on rapidly. Two hours completes most ores, though four hours is sometimes necessary. Before introducing mercury the heat must be allowed to subside so far as to avoid all volatilization of the mercury. The amalgamation being completed, the ore is discharged in the shape of a mass of ore intimately mixed and combined with mercury into a Steven's Galvanic Settler—a tub with a copper bottom and floating zinc lid containing acidulated water, constituting the simple elements of a galvanic battery. The negative pole being at the bottom, the precious metals are precipitated, and run off as usual. It is claimed that in this way mercury is less liable to be lost, notwithstanding its intimate admixture with large quantities of barren ore or gangue, than in ordinary wet amalgamation.

The circumstance alleged of amalgamating only the gold and silver in ores combined with such troublesome substances as lead, copper and antimony, is ascribed by Mr. Paul to the development of some new principle, the nature of which will be more fully dwelt upon hereafter.

The machinery certainly is simple and inexpensive enough. Cylinders may be made to contain from fifty pounds to five tons; cage brush will make all the fire that is necessary; and little water is required for the settling, which may be used over and over again; a fact which would render this process applicable to many localities where reduction has been heretofore impracticable.

A large number of certificates of the result of workings by this process, in comparison with ordinary wet amalgamation, have accumulated in the inventor's hands from which we select the following:

Mr. T. B. Wingard, Secretary of the Kearsarge Gold and Silver Mining Company, Inyo County, states that in consequence of the ores of that company being so thoroughly impregnated with lead, antimony, and other rebellious substances, they have not been able to get out over $123 to the ton by pan working, and the bullion went down to forty-seven cents to the ounce; while by this process the same ore was worked up to $314 to the ton, and the bullion brought out was .962 fine, or $1.91 to the ounce, of which $1.21 was silver, and 70 cents gold; chemically pure silver being $1.29 to the ounce.

Mr. Henry R. Reed, Superintendent of the Cordillera Mining Company, Chihuahua, Mexico, testifies that the moderately rebellious ores of that district worked up to $780 per ton by ordinary pan amalgamation, and to $867.40 by the present process.

Nathaniel Page, of the Quartz Mountain mine, Mariposa County, states that some auriferous pyrites from that mine were worked by the Plattner chlorination, and also by the present process; resulting in favor of the latter by the difference of the silver contained in the ore, which is lost in Plattner's chlorination; amounting to $4 or $5 to the ton.

Mr. N. O. Noyes, of the Chase mine, Arizona, containing gold sulphurets with some galena, states that he could not obtain $10 a ton by mill working, while this process paid him $37.74, the ore assaying $44.86,—nearly all gold.

We are informed by Mr. Paul that three different parties, who have thoroughly and practically tested this process, have ordered the necessary apparatus at the Miners' Foundry, viz': Mr. Chapin, of Silver City, Nevada; Mr. Noyes, of Prescott, Arizona; and the Silver Sprout Company, Inyo County.

MECHANICS' INSTITUTE.—The last monthly meeting of the San Francisco Mechanics' Institute, was more than usually important on account of the installation of the new officers, and of various propositions considered. Mr. Hallidie, the outgoing, and also the incoming President, read his annual address, in which he alluded to the rapid advance of the mechanic arts, and mentioned especially the proposals to establish a Polytechnic Institution, in connection with the Institute, which subject is in the hands of a committee. The Institute, he said, was steadily and surely progressing. It now numbers 1,399 members, has a library of 12,431 volumes, and property worth $140,854. Mr. Brittan advocated a re-incorporation of the Institute, and in the course of his remarks favored the removing of all entrance fees to the library. His motion to direct the officers to take the necessary steps to re-incorporate, was carried.

RECEIVED.—We have received "Lower California, its Geography and Characteristics, with a sketch of the Grant and Purposes of the Lower California Co., 8vo. pp. 44. Also a copy of the Transactions of the California State Agricultural Society, from the late Secretary, Mr. I. N. Hoag, containing amongst other valuable matter, the report of Wm. P Blake on California productions, etc., at the Paris Exposition."

ANNUAL REPORT OF THE HALE & NORCROSS.—We have received the eighth annual report of this prominent mining company, embracing the statements of George S. Mann, President, C. C. Thomas, Superintendent, and Joel F. Lightner, Secretary, with an ore table showing the entire product of the mine. The cost of reduction is given at only $13.09½ per ton.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

New Job Printing Office.

In order to devote our attention more exclusively to the publication of our paper, and the business of our American and Foreign Patent Agency, we have disposed of the presses and job printing material, and fixtures, in our office—with the entire future good will and patronage of our Job PRINTING OFFICE,—to George Spaulding and Harrison Barto. Messrs. Spaulding & Barto will continue the operation of the same, in our office, 414 Clay street, under the title of "The Mining and Scientific Press Job Printing Office."

Both of these gentlemen are practical printers of good attainments and enviable reputation. They have been long engaged in this office, and it is with pleasure that we can recommend them to the favor and patronage of all our old customers in the line of Job Printing.

A. T. DEWEY.
W. B. EWER.

P. S.—This change relates to our job printing department alone, our patent agency and newspaper business remaining as before.

DEWEY & Co.,
Mining and Scientific Press Office, 414 Clay street.
MARCH 1, 1866.

CALIFORNIA PROTECTIVE ASSOCIATION.—One of the noteworthy features of a progressive civilization consists in the large and increasing number of associations organized for the relief, protection, or to advance the interests of their members, respectively, embracing all classes of the community, and nearly every branch of industrial pursuit. The attention of our readers is specially called to the prospectus of the above mentioned association, which appears in full in our advertising columns. As this form of insurance is comparatively new, and different in some respects from most life plans, it is worthy of examination, and possesses some attractions not presented by the latter. The objects, advantages, and general management of the association, are so fully set forth as to obviate the necessity of an extended notice. ***

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M TAYLOR, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

[From the new "Dominion."]
At this season, when coughs and colds are so prevalent, an effectual remedy, and one easily obtained, is Perry Davis' Vegetable Pain Killer. It is no new nostrum, vended by unknown agents, but has stood the test of over twenty years, and those who use the article, internally or externally, will connect with it grateful recollections of its worthy inventor.—*Hastings' Chronicle, C. W.*

PAIN KILLER.—The testimonials borne to the efficacy of this valuable medicine are sufficient to warrant its introduction in every house. Our own opinion is that no family should be without a bottle of it for a single hour. In flesh wounds, aches, pains, sores, etc., it is the most effectual remedy we know of. A bottle will last for a very long time, and its low price places it within the reach of all.—*St John News.*

☞We are glad to learn that the "Pain Killer" is having so large a sale in our city. We have every reason to believe it to be an almost never failing cure for pain, and a medicine that no family should be without.—*Montreal Pilot.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

To Quartz Miners.

Having a new system of Amalgamation, styled the
PAUL & WOOD ELECTRIC PROCESS,
And which has been so fully tested as to be worthy of your consideration, I now invite it, relying only on the precious metals produced, cheapness and simplicity of machinery, to gain favor for it.

Parties having mines containing a high percentage of gold and silver, but which cannot be obtained, on account of fineness, or rebellious character of the ore, will do well to investigate. Attention given to communications.

Address, ALMARIN B. PAUL,
408 California st., or Miners' Foundry,
11v18-1m San Francisco.

PROSPECTUS
—OF—
THE SALT POINT
SILVER MINING COMPANY.

This mine is situated on the western slope of Treasure Hill, about half a mile from Treasure City.

It is admirably located for working purposes, being on the hillside, at an elevation of six hundred feet above the flat or "swale" through which the road to Shermantown passes. The road is on an easy grade, about one mile from Shermantown, where the principal mills are located. The flat in front of the mine affords ample room for the dumping and piling up of milling ore.

The mine is surrounded by fine groves of trees of a large growth; the wood of which for fuel can be purchased at $8 per cord, and at a corresponding rate for timber for mining purposes.

The ledge lies favorably for working by a tunnel or cut, it is well defined, and apparently from ten to twelve feet in width. Assays of the rock are remarkably uniform in character, ranging from $380 to $385 per ton.

Work is now being done upon the mine, and it is believed that the sale of One Thousand Shares of Full Paid Stock at $2 50 per share will give all the working capital necessary for its development. The Company are now working the mine, through a shaft from fifteen to twenty feet in depth, and, so far as developed, the mine shows itself to be one of the richest and most extensive in this wonderfully rich District. Within a few days the owners have been offered for the whole mine $ 0,000, but prefer to sell a portion for working capital at a lesser rate.

Subscriptions received at the office of the Company, No. 211 California street.

E. J. WEEKS, President.
O. OICKINSON, Jr., Treasurer.
11v18-2w T. A. MUDGE, Secretary.

To Mining Secretaries.
THE NEW COMBINED
Stock Ledger and Journal,
The most simplified form that has ever yet been offered to the public, is now ready, for sale. This one book is a complete abbreviation of the old Ledger, Journal and Transfer Book, and therefore takes the place of the three.
Stock Incorporations
Now organizing are invited to examine this Book before buying the old style.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL-SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address NEWEY & CO., Mining and Scientific Press office, San Francisco.

SCIENCE AND ART GO HAND IN HAND.—The following is from a new work entitled "How Crops Grow," by S. W. Johnson, Professor of Agricultural Chemistry in the Sheffield Scientific School, Yale College:

"Strictly considered, the art and science of agriculture are of equal age, and have grown together from the earliest times. Those who first cultivated the soil by digging, planting, manuring and irrigating, had their sufficient reason for every step. In all cases, thought goes before work, and the intelligent workman always has a theory upon which his practice is planned. No farm was ever conducted without physiology, chemistry and physics, any more than an aqueduct or a railway was ever built without mathematics and mechanics. Every successful farmer is, to some extent a scientific man. Let him throw away the knowledge of facts and the knowledge of principles which constitute his science, and he has lost the elements of his success. The farmer without his reasons, his theory, his science, can have no plan; and these wanting, agriculture would be as complete a failure with him as it would be with a man of mere science, destitute of manual, financial and executive skill." * * * * "It is the boast of some who affect to glory in the sufficiency of practice and decry theory, that the former is based upon experience, which is the only safe guide. This is a one-sided view of the matter. Theory is also based upon experience, if it be truly scientific. The vagarizing of an ignorant and undisciplined mind is not theory. Theory in the good and proper sense, is always a deduction from facts, the best deduction of which the stock of facts in our possession admits. It is the interpretation of facts. It is the expression of the ideas which facts awaken when submitted to a fertile imagination and well balanced judgment. A scientific theory is intended for the nearest possible approach to the truth. Theory is confessedly imperfect, because our knowledge of facts is incomplete, our mental insight weak and our judgment fallible. But the scientific theory which is formed by the contributions of a multitude of earnest thinkers and workers, among whom are likely to be the most gifted intellects and most skillful hands, is, in these days, to a great extent worthy of the divine truth in nature, of which it is the completest human conception and expression."

DECADES.—It is a curious fact, says the *Times*, that gold was discovered in California in 1848, and the rush to the Pacific coast took place in 1849. Silver was discovered at Washoe in 1858, and the immigration thither commenced in 1859. The fabulous treasures of White Pine were discovered in 1868, and during this year of 1869, a prodigious human tide will set toward the new Silverado from both sides of the continent. The movements of the car of progress seem to be by decades. That of 1878 and 1879 will probably be the absorption of the Spanish American republics down as far as Panama; provided circumstances shall not have precipitated the event before the coming decade is half over.

DIFFERENCE BETWEEN DISINFECTANTS AND ANTISEPTICS.—The antiseptics, such as corrosive sublimate, arsenical acids, carbolic acid, etc., act, as such, by destroying all sources of decay and decomposition; that is to say, they destroy or prevent the formation of the *germs* of putrefaction and fermentation, without acting on the mineral or vegetable matters present; while disinfectants operate either by oxydizing the gaseous products given off by putrefaction, as in the case with permanganate of potash, or by removing their hydrogen, as is the case with chlorine.—*Medical Investigator.*

MACHINE POWER AND LABOR.—The machine power of England and Wales is competent to perform the labor of nearly six hundred million of men, and is probably greater in productive capacity than the labor power of all the world beside. The machine power of the United States, though growing with amazing rapidity, does not more than equal the labor power of two hundred millions of men.

SALT LAKE PERMANENTLY RISING.—It is stated that explorations made by General Conner on Salt Lake, in his new steamer, prove that the water has risen thirteen feet since the first surveys, and is rising now one foot per year. The boat ran for a mile in one place over what was grazing land five years ago. It is thought that perhaps the subterranean outlet has been partially choked up.

COLORED FLAMES PRODUCED BY ALKALINE SALTS.—Tobacco contains nitrate of potash. If a cigar be lighted at or near the edge of a flame of a common bat-wing gas burner a beautiful violet tinge will be imparted to the flame. The violet color is the characteristic color of the heated vapor of potassium salts. Soda imparts to the flame a rich yellow tint. Very minute quantities of these metals can be detected thus; but the flame ought to be as free as possible from the vapors of other substances, as the presence of more than one may easily obscure, or at least modify the tint of the flame, so as to prevent the success of the experiment. The salts of sodium (more particularly the chloride) are to be found almost everywhere. Even the dust floating in the air contains it. Light your alcohol lamp, set it upon your table, and let it stand until the flame is steady. Now drop a book upon the table. Instantly your flame, which was before a very pale blue, emitting very little light, becomes strongly luminous and bright yellow. This is because you have raised a dust, and some of its particles containing chloride of sodium have passed into and have been vaporized by the flame.—*Scientific American.*

THE NEW ZEALAND GOLD FIELDS.—The Thames District, not far from Aukland, on the northern Island, are continuing to yield remarkably well. A crushing of 216 pounds of rock, taken from the vein worked in the Dawn of Hope claim, yielded 252 ounces of retorted gold; and a piece of gold quartz found in the Clyde claim, on Tapu creek, which weighed 25 ounces Troy), was estimated to contain at least seven-eighths of pure gold of a very rich quality. It was washed out of the quartz taken from the vein at a depth of twenty-eight feet, and comprised flakes of pure gold, intermixed with quartz of a semi-crystallized and brown character. The fine rubble accompanying the quartz was thick with gold.

COOSE BAY COAL.—The coal business at Cooso Bay is having a rapid and renowned development; and at no time since the commencement of the shipping of coal from that point in 1856 to this port, has that branch of industry looked so favorable as at present. We understand that the Eastport Coose Bay Coal Mining Co. intend to ship large quantities to this market henceforth. The members are Levi Stevens, I. W. Raymond, J. S. Dean, Oliver Eldridge, Claus Spreckles, W. H. Sharp, and J. Lawrence Pool. From the report of Mr. Ashburner, the mining engineer, who has made a thorough survey of the coal fields of Cooso Bay, it appears that the coal produced from the mine of this company is of the quality known as "brown coal;" that it is of a superior quality for domestic purposes, is remarkable clean, leaves but little ash, burns without disagreeable odor, and can be laid down in San Francisco at a cost of seven dollars per ton. The mine belonging to the above company comprises six hundred and forty acres of land, underlaid by the coal deposit.—*S. F. Times.*

DENSITY AND THE BOILING POINT.—The presence in a liquid of a substance dissolved in it (as salt in water) resists ebullition and raises the temperature at which the liquid boils. The boiling point of saturated brine under one atmosphere is 226° Fah., and that of weaker brine is higher than the boiling point of pure water by 1 2° Fah. for each 1-32d of salt that the water contains. Average sea-water contains 1 32d; and the brine in marine boilers is not suffered to contain more than from 2 32ds to 3-32ds.

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.
The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of home baths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.
"A SUCCESS UNPRECEDENTED."
[See following extract from the Globe of May 14, 1868.]
"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.
Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Engineering.

MEXICAN INTERNAL IMPROVEMENT SCHEME. In connection with the railroad now building by a British company between Vera Cruz and Puebla, a Mexican company has been organized to continue the route to the Rio de las Balzas, in the rear of Acapulco, a branch of the Mescal, passing the great volcano Popocatapetl, and down the latter river to steam navigation, or to the sea. Another company is forming to make the Mescal navigable to the sea. An expenditure of $100,000 is anticipated, and is to be provided for by the sale of a thousand shares at $100 each. The net annual profits from the transportation and sale of salt, merchandise, Brazil wood for exportation, ajonjoli, soap, hides, fruit, ore, passengers, etc., are expected to reach $184,000, after deducting current expenses. The precious woods and rich mines on the margins of said river would alone secure a fortune to those who would take the matter in hand, and this long deserted waste would give employment to thousands who are now shut off from the rest of the world and living as the Mexicans do, from hand to mouth.

OBSERVATIONS FOR LONGITUDE AT SALT LAKE.—Professor George W. Dean, Assistant in the U. S. Coast Survey, has set up a fiue transit instrument on Temple Block, Salt Lake City, and has been making transit observations and telegraphing time in counection with Cambridge, Massachusetts, and Professor Davidson's observatory in this city. It is stated that with No. 8, or common wire, electricity passes at a rate varying from 20,000 to 25,000 miles a second. After getting all these observations recorded, it will,—says the Salt Lake *Reporter*, for the Coast Survey,—require a year to reduce them, amd at the end of that time the latitude and longitude of Salt Lake City will be determined with the utmost exactness.

THE SUEZ CANAL will, according to later French papers, not be completed till the end of the present year; but as there are not less than 20,000 men employed, the great event cannot be postponed long. The canal is one hundred and twenty miles long. Steam dredges and excavators scoop out the sand and dirt. Vessels will be propelled through the canal by means of endless chains along the bottom, to be worked by stationary engines at intermediate points. The tariff charges will be about $5 per ton.

THE PROJECTED MOKOMOKE HILL WATER WORKS at White Pine, are in the hands of A. P. Stanford and other capitalists of San Francisco, and are likely to be proceeded with energetically, as the franchise is said to be valuable. The water is to be taken from Illapah Creek, a stream two miles east of Hamilton, carrying several hundred inches of excellent water. The plan contemplates lifting this water to the top of Mokomoke Hill, some 800 feet, whence it will be supplied to Hamilton and the numerous quartz mills that will occupy the ravine skirting the northern and eastern base of Treasure Hill, and also to such towns as may bereafter spring up along the latter, the design being also to carry it to Treasure City some time during the present year. The engines and pipes for this work have been already ordered in San Francisco. Mr. Von Schmidt is the engineer.

WHITE PINE ROAD, WATER AND LAND COMPANY.—A company bas been formed, and has filed articles of incorporation in this city, for the purpose of bringing water by means of a pipe from the Base Range to "White Pine City," a quarter of a mile below the Eberhardt, and of building a road from Treasure City to the same place; the company owning there 500 acres of land, of which 125 acres are already subdivided into town lots.

THE bridge over the Yuba is a mile and one-eighth in length—the longest in the State.

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment on one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John R. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

New Incorporations.

Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SALT POINT S. M. Co.—White Pine, Nev. Feb. 26th. Capital stock, $100,000,000; 10,000 shares, $100 each. Trustees: O. Dickinson, Jr., B. T. Browne, E. B. Dickinsou, E. J. Weeks and R. E. Brewster.

BOWDEN S. M Co.—White Pine, Nev. Feb. 26th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: M. Tubbs, R. Sherwood, C. B. Young, E. Haft and H. L. Lewis.

LOUISIANA S. M. Co.—White Pine, Nev. Feb. 27th. Capital stock, $200,000; 2,000 shares, $100 each. Trustees: A. Hayward, A. P. Stanford, Thos. Bells, M. J. McDonald and J. D. Fry.

PHŒNIX S. M. Co.—White Pine, Nev. Feb. 27th. Capital stock, $800,000; 16,000 sbares, $50 each. Trustees: J. L. C. Wadsworth, J. D. Fry, A. Cannon, G. F. Walters and W. C. Parker.

BROTHERS MINING Co.—White Pine, Nev. Feb. 27th. Capital stock, $1,500,000; 5,000 shares, $300 each. Trustees: T. C. Pedler, S. H. Wetherbee and J. W. Wesson.

LITTLE RIVER M. Co.—White Pine, Nev. Feb. 27th. Capital stock, $1,500,000; 5,000 shares, $300 each. Trustees: T. C. Pedler, S. H. Wetherbee and J. W. Wesson.

BADGER MINING Co.—Same capital, shares and Trustees as Little River Co.

SILVER MOON M. Co.—White Pine, Nev. Feb. 27th. Capital stock, $800,000; 16,000 shares, $50 each. Trustees, C. S. Mann, M. Ashbury, Wm. Sherman, A. Massey and T. R. Hopkins.

BLUE ROSE S. M. Co.—White Pine, Nev. Feb. 27th. Capital stock, $800,000; 16,000 shares, $50 each. Trustees same as Silver Moon.

NORTH PACIFIC STEAMSHIP Co.—San Francisco. March 5th. Capital stock, $5,000,000; 50,000 shares, $100 each. Trustees: Ben. Holladay, W. Norris, W. C. Ralston, Lloyd Tevis, W. F. Babcock, A. Hayward and S. F. Butterworth.

WATER FRONT BUILDING ASSOCIATION.—San Francisco. March 5th. Capital stock, $36,000; 48 shares, $750 each. Trustees: A. S. Gould, James Graves, G. W. Inslee, W. G. Doolittle and F. B. Wilde.

PIOCHE SHAFT AND MINING Co.—White Pine, Nev. March 5th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: E. N. Terrey, F. L A. Pioche, S. B. Clark, M. W. Kales and Thos P. Hawley.

BEN FRANKLIN MINING Co.—White Pine, Nev. March 5th. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: B. H. Freeman, Jno. McDonald, Jr., R. G. Brown, E. L. Smith and J. A. Eaton.

MOCKING BIRD MINING Co.—White Pine, Nev. March 5th. Capital stock, $1,400,000; 14,000 shares, $100 each. Trustees: W. H. Smith, Robert Riddle, C. S. Kasson, E. H. Shaw and J. M. Buffington.

EBERHARDT M. & M. Co.—White Pine, Nev. March 5th. Capital stock, $12,000,000; 120,000 shares, $100 each. Trustees: Frank Drake, E. Appleton, J. W. Crawford and E. R. Sproul.

SAN FRANCISCO DAILY HERALD Co.—March 8th. Capital stock, $200,000; 200 shares, $1,000 each. Trustees: S. F. Butterworth, L. Maynard and F. L. Sullivan.

HEARST MINING Co.—White Pine, Nev. March 8th. Capital stock, $3,000,000, in $100 shares. Trustees: D. D. Colton, A. Hayward, J. O. Earl, J. M. Wilson and C. G. Hooker.

TREASURE BOX MINING Co.—White Pine, Nev. March 8th. Capital stock, $2,000,000, in $100 shares. Trustees: George Hearst, Thomas Sunderland, George Wallace, A. E. Head and Lloyd Tevis.

CHICAGO MINING Co.—White Pine, Nev. March 8th. Capital stock, $2,000,000, in $100 shares. Trustees: A. Hayward, J. C. L. Wadsworth, John O. Earl, George Hearst and A. E. Head.

NEW ERA G. & S. Co.—White Pine, Nev. March 8th. Capital stock, $1,000,000, in $100 shares. Trustees: John Curry, S. F. Reynolds, D. McLaren, W. Hutchinson, C. H. Chamberlain, James Battersby and Albert Shepard.

ASTOR SILVER MINING Co.—White Pine, Nev. March 9th. Capital stock, $1,000,000, in $100 shares. Trustees: William Selby, John B. Dilley, Henry W. Fortune, Joseph C. Edwards and William P. Pierson.

MAZEPPA SILVER MINING Co.—White Pine, Nev. March 9th. Capital stock, $800,000, in $100 shares. Trustees: David L. Williamson, W. S. Perkins, A. C. Morse, W. C. Budd and C. E. Gibbs.

SILVER EAGLE MINING Co.—White Pine, Nev. March 8th. Capital stock, $8,000,000, in $100 shares. Trustees: A. E. Head, David D. Colton, W. Thompson, Jr., G. Wallace and George Gordou.

DORA CHAUNCEY CONSOLIDATED SILVER MINING Co.—White Pine, Nev. March 8th. Capital stock, $1,200,000, in $100 shares. Trustees: Theodore Reichert, A. J. Shrader, C. P. Vau Schaack, George Loomis, H. B. Rathbun, J. T. Pomeroy and Samuel Drake.

PICK AND SHOVEL MINING Co.—White Pine, Nev. March 12th. Capital stock, $1,600,000, in $100 shares. Trustees: A. P. Stanford, A. W. Von Schmidt, Jos. McArthur, John W. Conner and George H. Ensign.

CITY PARK HOMESTEAD ASSOCIATION.—San Francisco. March 10th. Capital stock, $54,000, in 360 shares. Trustees—Stephen T. King, J. N. Choynski, M. Waterman, Samuel Feder and B. P. Avery.

SILVER STAR CONSOLIDATED S. M. Co.—White Pine, Nev. March 10th. Capital stock $520,000, in shares of $100 each. Trustees: Anson Averell, J. M. Buffington, C. I. Hanson, T. R. Reynolds and W. P. Raymond.

Small Pox.

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant out, and should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 128 Geary street, 25v17-3m

White Pine Items.

A working assay of 23½ pounds of ore from the Ida mine, White Pine, produced $10 08, showing a return for the ton of $757 86, being 986 fine.

THE following infectious item is extracted by the *Enterprise* from a letter written by Captain Rawlings, lately Superintendent of the Manhattan Mill, Washoe, and dated March 4th:

"Great excitement this morning on Treasure Hill. New discovery one mile north of town. The ore assays as high as $9,000. At least 2,000 have gone to see it. The sides of the hill are covered with people making locations. I have sent a man up. You must come and see this wonderful country. It is almost impossible to sink a hole in the ground anywhere without finding rich ore. The only question is to extent. Men every day bring in small bars of silver to the bank for sale. Everybody has money. This is certainly the "poor man's paradise.'"

LAST accounts from the "Pogonip" represent the weather to be as balmy as spring, and the *Alta* correspondent writes: The rush has commenced, and the stage companies find it impossible to accommodate all who arrive at Elko, consequently they have advanced the fare to $50. One stage arrived at Hamilton yesterday with eleven passengers, the fare amounting to $550, and the freight to $250, so that the gross receipts of the trip amounted to $800.

SOME of the members of the House-Carpenters' Eight-Hour League have on foot a proposition to use $2,500 of the funds on hand to send two practical miners to White Pine to locate mines for the League, and that twenty per cent. of the monthly dues of the association shall be set aside for the expense of working the mines.

THERE are nine "Great Eastern" claims on the Recorder's books at White Pine; and in some cases there are said to be as many as fifty claims of the same name.

THE number of rich mines at White Pine affords such excellent domain for wildcat, that the germ promises to become as prolific as in 1860–3. In these times nothing should be done in mining without the fullest information.

FROM the *Bulletin* correspondent's letter, dated Treasure Hill, March 5th, we extract the following:

Ores that will yield from $60 to $100 per ton exist in great abundance—there being considerable quantities that will mill three or four times that amount, while those of a grade ranging from $30 to $60 per ton seem quite inexhaustible. * * * The ores here can generally be extracted at small cost, are facile of reduction, and can be transported to the mill at a moderate expense; as they must always pass over a descending grade, while wood, water and salt can be supplied at rates that will insure their economical reduction. With the number of developements made, it is estimated that the mines would sustain a population of at least 30,000, and that they will afford a sufficiency of $100 ore to keep 500 or 600 stamps employed as soon as they can, or, at least, are likely to be brought in; while there is no limit to the amount that could be supplied to smelting works were they ready for operations. * * * The entire probable immigration is variously computed at 50,000, 60,000, and even as high as 70,000, it being estimated that 30,000 will be drawn from the States and Territories west of the Rocky Mountains, and as many more from points to the east of that meridian. * * * Eight or ten thousand might settle to advantage in the valleys adjacent to White Pine, or along the Humboldt, where the Central Pacific Railroad Co. have much excellent land to dispose of. * * * In the California mine a streak of veritable Eberhardt ore has been laid open at a depth of 15 or 20 feet, having every sign of permanency. Of this ore two men regularly extract half a ton per day, that will mill at the rate of $2,000 per ton. The body of $200 ore already exhibited in this mine is immense. * * * The strike spoken of in my letter as reported to have been made in the Hidden Treasure, turns out also a reality. The Independence, Featherston and Hornet improve daily under a steady and judicious application of labor, while further explorations of the rich one channel laid open sometime since in the Mazeppa fully justifies the importance attached to that discovery from the first. Quite recently a fine body of best class ore has been reached in the Silver Cloud claim, lying below the Genesee, on the western verge of Chloride Flat. It is the earliest location made in that vicinity, and, it is feared, will cut a broad swath through the numerous locations since made on that part of the Flat, which famous locality has now to share its glories not only with other Flats, such as Pogonip, Bromide and Alta, lying near by, but also with a still more formidable rival situate over against the Base Metal Range, directly opposite and some three miles to the west. Here some rich chloride ore, as yet only in small quantities, has been found, causing quite a rush to the spot. As the snow, however, still covers the ground to a depth that precludes successful prospecting in the neighborhood, it will probably be sometime before the extent and value of this discovery can be fully ascertained.

AN illustration of the great richness of this district, says the White Pine *News*, was given during the past week. Masten & Arrington, at Menker, engaged two men to sink a well in Mazeppa Cañon, near their establishment. After sinking to the depth of about fifteen feet, a ledge bearing a rich body of ore was encountered and located as a mine by the well-diggers. Of course no more progress for the purpose proposed could be made, and a new locality was sought. Here again, after sinking a few feet, another rich vein was struck, claim made and well abandoned. This was too rich a place to devote to furnishing water only, and in a more distant locality it was concluded to dig the well. Sinking has been resumed, but with what result the *News* is not advised.

SOME of the recent ore from La Monte mine, 250 feet north of the Eberhardt and parallel thereto, shows both native gold and silver.

PROSPECTING parties are already venturing out into the wastes. For many of these the summer will be long enough, and weary distances and rough mountains gone over will be looked back upon with reduced energies and hopes, yet with no reason to be at all sorry for having made the trip. One under James Basey, has left Treasure City and has gone in the direction of Steptoe Mountain. They intend to prospect in the Wasatch Range, south of Salt Lake. The party will be absent for several months.

SOME 800 or 900 tons of ore have accumulated on the platform of the Stanford mine, with large quantities on that of the North Aurora, and considerable lots about the shafts of many other claims, the most of the latter being so assorted as to constitute a high grade ore.

Railroad Items.

CAPT. W. H. FREEMAN, who has been exploring a line of railroad from the Blue Mountains, Oregon, to Puget Sound, arrived at Seattle, W. T., Feb. 25th—distance, 247 miles. Left the Blue Mountains Jan. 2d; arrived at the Snaquaimie Pass, Feb. 13th; found the snow in the Pass about 5½ feet deep; length 23 miles; grade 65 feet to a mile; considers the route one of the finest mineral and timbered countries in existence, terminating at the finest harbor in the world.—*Portland Oregonian.*

ALL the grading on the Western Pacific Railroad, between Sacramento and Stockton, is completed. Seven hundred graders are at work at various points between Stockton and Livermore's Pass, the bulk of them being near the latter place, where the heavy work extends for about eight miles. Masons are engaged in building culverts and doing other stone work in Alameda Cañon. After the grading has advanced enough to let the track-laying commence in the cañon, a switch will be put down from Vallejo's Mill to the Warm Springs Landing, where iron and ties will be landed.

ON Feb. 23d all the bridges on the Union Pacific in Weber Cañon, were reported completed down to Strawberry Creek, and all the forces available were engaged on the two remaining bridges, viz., across Strawberry Creek, and the Weber at Devil's Gate. Later dispatches report the completion of the bridges, and the arrival of the locomotive at or near Ogden.

It is alleged that much of the road bed is being made out of frozen clods, which will necessarily subside as soon as spring comes.

THE average travel over the Central Pacific Railroad is about 200 each way daily.

ON Wednesday the extension of the San José Railroad from San José to Gilroy, a distance of twenty miles, was inaugurated by a grand excursion. This road is intended by those interested in it, to be the first branch of the South Pacific, which is to be in running order by the summer of 1873.

THOSE SPECTACLES advertised "Lost," for which a very large reward was offered, were purchased at Muller's, 205 Montgomery street. *

Resources and Developments.

A BEET SUGAR FACTORY is about to be erected by the Sacramento Beet Sugar Association under the auspices of Mr. Wadsworth, who lately returned from a second trip to Europe, where he has been spending some months as a laborer in beet sugar factories, to familiarize himself with the details of the business. Mr. Wadsworth is enthusiastic in praise of the simplicity of making sugar from the beet as compared with the cane sugar process, and confident that the business will pay a large profit.

SLATE FOR BUILDINGS.—Since our item upon the economy, durability and weather-proof qualities of slate for covering buildings in this climate, we learn that an extensive quarry exists in Tuolumne County, and that the quality near the surface is unusually good, promising a superior material at a little depth. A specimen of that near the surface has been left at Barry & Patten's, 413 Montgomery street.—*Alta*, March 6th.

We understand that the working force engaged in developing this quarry will be materially increased the coming week, and the first shipment of roofing slate may be expected in this city by the first of May. All the slate heretofore used in this State has been imported at a cost of about $24 to the ton. A material equally good, can be furnished from the above locality at a cost, with reasonable margin for profits, not to exceed twelve or thirteen dollars.

OLIVE TREES.—People at Santa Barbara, says the *News*, have set out this season 200,000 olive cuttings, from mature trees. The demand has been so great that it was found impossible to supply the market with the better class of olive, and consequently parties have been obliged to put up with an inferior article. E. F. Sanborn, of San Diego, has shipped several thousand cuttings to Santa Barbara, for Captain Wilcox and others.

PATENT OFFICE TO REMAIN INTACT.—The House resolution providing additional accommodations for the Interior Department was discussed for two hours or more in the Senate ou Monday, Feb. 1st. Many Senators held that as the inventors of the country bore the expenses of the Patent Office, and the Government really derived a handsome revenue from it, the building ought not to be diverted from the uses to which it was originally intended, and hence the models, which Mr. Fessenden says accumulated at the rate of 14,000 per annum, will be left alone in their glory.

THE new discovery in the Base Range is a mile and a half due west of Treasure city, or three miles by the road. The locality is known under the various names of Northern Light Hill, Chloride Flat No. 3, and Base Range, but a town has been laid out and named Babylon. It is said to be a favorable locality for mining.

New Mining Advertisements.

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of March, 1869, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

By order of the Board of Trustees.

HORACE MORRISON, Secretary.

Office, N. E. cor. Front and Jackson streets.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

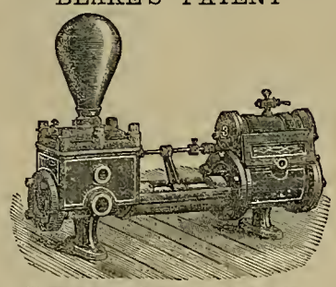
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape out the seales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have had one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

Address P. O. box 17. 23v17tf

LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE

Declared by connoisseurs to be the only

GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L and P give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Venders of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO. San Francisco. 3v18 1v

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Our Idaho Correspondence.

MINING NEWS.

EDITORS PRESS:—By private letter from Yuha, I learn that the energetic Superintendent of the Monarch Gold and Silver Mining Company, Mr. Atkins, is now down on the Atlanta over one hundred feet, and has found the vein much richer than ever. There are two veins in the main lode running parallel to each other; one is two feet and the other six inches in width, plainly discernible in character from the other parts of the pay streak or seam, the whole seam containing precious metals, and the matter enclosed between the casings being over twenty-five feet—some say near forty, but I will be moderate. These two veins are now yielding ore that assays over $20,000 to the ton, and the highest assay given is $26,400. Does not this put White Pine in the background?

Work done last fall by the owners of the Willamette lode, running east from the Discovery Stake, gives evidence that at the depth of seventy-five feet there is a splendid body of ore, very rich in silver, and although no practical assay of it has been made, yet by common fire test, experienced mineralogists pronounce it first-class ore. The owners on the west propose to open up at a low level this spring. The lode at seventy-five feet deep is over six feet wide, easy to work—timber in the way, which has to be cleared,—and good water-power close at hand.

White Pine and Elko have taken away most of our floating population, and some that we did not like to lose; but Boise City, though dull, is not dead yet. We hope yet to see a railroad near, if not right at our doors, and think that the railroad companies are making an error in judgment in not bringing their iron horse snorting, close to our vicinity.

COMMUNICATIONS.

The storms which have been hurrying the country with snow, or inundating it with water all around, have left us untouched, and we have been reveling in warm spring weather.

It is now a week since we have had a through mail from the East, and the California route is but little if any better.

Hailey is running the stage through from Umatilla to the railroad at Ogden and Salt Lake, and promises, as soon as the roads get good, to make the distance, 625 miles, and the Blue and other mountains en route, in eighty-four hours; Umatilla to Boise, 1½ days; Boise City to Ogden, two days.

PEGASUS.

Boise City, March 5th, 1869.

BREAD MAKING.—The following communication has been called out by the article in our issue of Feb. 6th, giving Professor Horsford's directions "How to make good bread:"

EDITORS PRESS:—How I make good bread; very much as Prof. Horsford advises, except that I prepare yeast as follows: Select one good potato about the size of a goose egg, cleanse, peel and grate it raw, add a table spoonfull of brown sugar and enough lukewarm water (80°) to fill a common bottle three-fourths full; cork it tight, and tie down the cork. In a day or two, according to temperature (which ought never to be much above 80°), it will be ready for use. Open carefully lest you lose all. The bottlefull will make four or five large loaves. If a spoonful or two of yeast is left in the bottle it can easily be renewed, and will be ready for use in less time. This method of preparing yeast will be convenient for those miners who cannot readily procure "Best Bakers' Yeast" at any moment they need it.

PROF. JEIGH ARRH.

PROGRESS IN AGRICULTURAL CHEMISTRY. It is only fifty-eight years since the first accurate analysis of a vegetable substance was made, and about forty years since Liebig commenced to make reliable and systematic determinations of the chemical nature of plants and soils. The fact is almost incredible, that up to 1838 so little positive knowledge existed concerning the agricultural value of *ashes*, that the Gottingen Academy offered a prize for a satisfactory solution of the question, "*Whether the ingredients of ashes are essential to vegetable growths.*"—*Boston Journal of Chemistry.*

ACTION OF SULPHATE OF SODA IN DYEING. The sulphate of soda, which is scarcely ever treated of in books on dyeing, because of its chemical indifference for coloring matters, elevates, as every soluble substance does, the specific weight, and thus also the boiling point of the solution. It is possible, for instance, to change the shade of aniline violet into blue or red, according as the temperature of the solution is more or less elevated. When the dyeing is performed in an acid bath (the dyers very frequently add sulphuric acid to their baths), the sulphate of soda combines with the free sulphuric acid and forms with it bisulphate of soda. In this manner the bath retains its acid reaction without the presence of free sulphuric acid. Hence, when half-woolen cloths are dyed, the cotton in them, extremely sensitive to the action of the mineral acids, will be very well preserved. Dissolved in water in great quantities, the sulphate of soda diminishes the capacity of the bath to dissolve the added coloring matters.

As an example;—the red coloring matters possess the property of combining only with the greatest difficulty with the fiber when dyed in acid bath. Therefore, wherever the substances are employed in the acid bath—and often this is necessary—the greatest part of the coloring matter is wasted and lost if the common process is employed. By adding sulphuric acid, the dying power of the pigments can be put into activity, and by varying the quantity of sulphate of soda employed, it is possible to control the combination of the pigment with the textile fiber. Therefore, by means of the sulphate of soda various shades can be produced.—*Dr. Reimann, in Scientific American.*

ELECTRICAL EXPERIMENT.—Procure four glass tumblers, and having wiped them dry, hold them over the fire, for the least moisture spoils the experiment. Place them upon the floor in a square, about one foot apart; place a piece of board upon the tumblers; and a person upon the board. This person is now completely insulated. Now take a common rubber comb, and having wound a piece of silk around one end of it, rub it briskly through your hair, and draw the teeth parallel to the insulated person's knuckles, leaving a little space between the comb and the hand. The result will be a sharp, crackling noise, and if it is dark, there will be seen a succession of sparks. Repeat the process until the phenomena cease. The person is now "charged" with electricity, the same as a Leyden jar. To draw off the electricity, approach your knuckles to the person's hands or his nose (being careful not to allow any portion of your body to come in contact with his), and there will be a loud snap and the sparks will be very brilliant. If a cat be held so that the charged person can place his knuckles in proximity with the animal's nose, it will suddenly appear as if it were in contact with an electric battery. Much amusement may be derived from this simple experiment.—*Boston Journal of Chemistry.*

AMERICAN ARMS ABROAD.—The New York *Sun* says the Remington Company has recently delivered to the Danish government, 40,000 of their guns, and to the Swedish government 30,000, and the Greek government has contracted for 15,000, which have not yet been delivered. The Remington pattern is a single cartridge breech-loader. The Cuban government has bought upwards of 20,000 of Remington and Peabody rifles,—the latter an arm manufactured in Providence. The Russian government has a contract with the Colt Firearms Company at Hartford, for 30,000 rifles, an improvement on the Prussian needle gun.

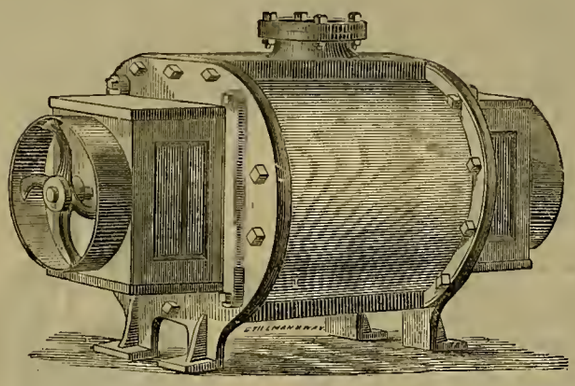
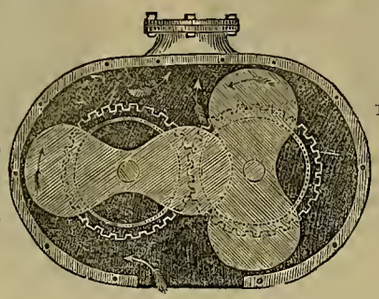
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.


ADAPTED FOR Smelting, Foundry, Mining and Steamships.


REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.
For circulars and further information, address
KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.
Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of
Chemistry, Assaying and Metallurgy,
That I am prepared to teach all the above branches in less time than in any European School.
I also undertake to assay and work any kind of ore, or mineral substances.
For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2065 Powell street, San Francisco 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED.
The correctness of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.
Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs Ploche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

JOHN TAYLOR & CO.
IMPORTERS,
AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
513 and 514 Washington Street,
SAN FRANCISCO.
WE are receiving direct from MESSRS. LANN & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior
ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.
A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865 11v10-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for work for 1,000 or 20-lb. charges of material for experimental purposes. 3v17

CUSHING & CO., Proprietors,
San Francisco.

OREANA (HUMBOLDT) SMELTING WORKS. Speaking of Oreana, Nevada, a correspondent of the *Enterprise*, of March 3d, says: This place was once a lively mining town made prosperous for a season by the works of a New York Company, which engaged in smelting some argentiferous ore. A few months since the works were suddenly closed, and Nason, the Superintendent, called to New York. We were informed that he was coming back to renew the work, but this we donbt. At any rate, Oreana is now a place where the notorious "Rip" might sleep in peace.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, Instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various brauches of Mathematical, Physical, and Natural Science.

The School is nnder the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

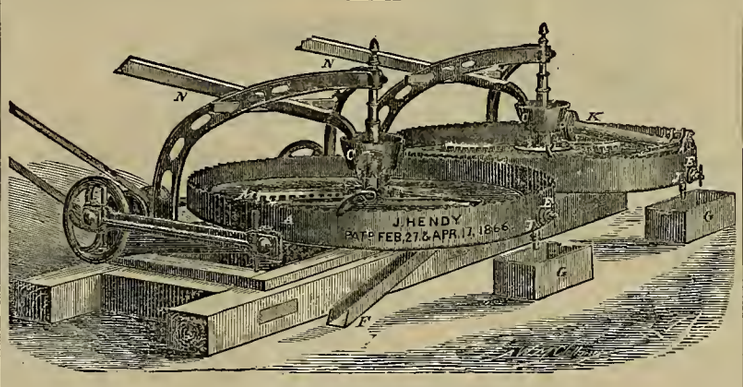
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.
Office at Union Iron Works.

No. 382.—Coal shale, from a point four to six miles east of Hamilton, White Pine District. It has an obsidian-like anthracite surface, and a fracture resembling cannel, but it is neither; a very large percentage of the specimen being earthy matter, so that it burns only from the surface to a certain depth, requiring further fracture to complete the burning process. The geological age of this coal is not determined, but it is probably carboniferous, or older,—a fact easily determined, as there are many fossils in the vicinity. The vein is horizontal, five to six feet in thickness, and under ten to fifteen feet of calcareous shales at the point of discovery. It is very probable that veins of a better quality will yet be discovered, as there are good, bad and indifferent veins in all coal countries. Presented by Julius Von Schmidt, C. E.

No. 383.—Auriferous pyrites which have proved very rebellious, for reasons unknown to the millman; from the Wheeler mine, Pine Grove, Amador County. The ore contains from $100 to $200 to the ton, but only $50 has been obtained in working. A lot of 300 pounds worked raw in a pan, with twenty pounds of mercury, resulted in a product of only half a pound of amalgam and mercury. Mr. Kustel's attention being called to the difficulty, it was surmised that some soluble substance in the ore—either a sulphate or chloride—might be the deleterious cause, and on examination a large percentage of sulphate of lime (gypsum) was found present, one part of which is soluble in 400 of water. On trying the effect of gypsum upon mercury, separately, however, the same deleterious effect was not experienced. The real cause of the rebelliousness of the ore appears, therefore, to remain in doubt. Presented by G. Kustel.

No. 384.—Pitch copper ore with red oxide of copper, from near the Buchanan copper vein, Fresno County. Presented with Nos. 385-6-7, by C. Wrage, of Antelope Ranch, Merced County.

No. 385.—Chrysocolla, or green silicate of copper; cuprit, the red oxide of copper, accompanied by the same in an earthy condition, which is called "tile ore;" and limonite, or brown iron ore; from the Buchanan copper vein (German Company) Fresno County.

No. 386.—Quartz stained with red oxide of copper and iron. Near Buchanan vein.

No. 387.—Tile ore, or perhaps red iron ocher disseminated in granular quartz, having fine crystals of white mica. Cowchilla Mining District, Mariposa County.

No. 388.—Black garnets in green-earth, or seladonite. Moore Hill, Mariposa County.

No. 389.—Serpentine, the hardness exceeding that of calcspar; and steatite, apparently the same, in a decomposed state, and a little harder than butter. The composition of both is, in the main, silicate of magnesia. From Duncan's Mill, Sonoma County, where it is known as mineral soap. Both steatite and serpentine bear intense heat; the latter, when put into water, has a soapy feel, but will not answer for washing. B. C. Bell.

No. 390.—Several dozen specimens of well-preserved fossils from White Pine District, partly silicified. Several of them are in quartz, which seems to be pseudomorphous from limestone. The most numerous and best preserved are brachiopods (mollusks) which appear to be of the epirifer and terebratula families, but there are very perfect seaweeds, (algae), corallines, etc. The memorandum of localities and details has not yet come to hand. Presented by J. E. Clayton, M. E., through Andrew G. Gove.

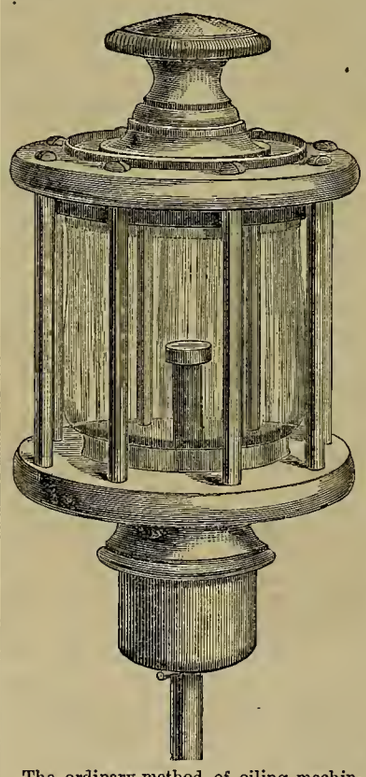
IMPERCEPTIBLE EARTHQUAKES.—Geologists tell us that the crust of the earth is subject to a constant lateral pressure, from shrinkage, (as is the case in the skin of an apple); and the faults and slidings of rock along its cracks and fissures, as witnessed in mines, are known to exist everywhere underground. It is a very reasonable conclusion that movements of strata past each other may be going on so gradually and regularly as to be ordinarily imperceptible. Delicate tests sustain the hypothesis. On the 29th of September, last year, in the Astronomical Observatory near St. Petersburg, Russia, a slight, almost imperceptible movement of the air in the spirit level was noticed, without any apparent cause. Councilor Wagner attributed it to an earthquake somewhere, and noted the hour and minute of the occurrence. Afterward it was known that at Malta there had been an earthquake at the time, and that the heaviest shock preceded, by several minutes, the observation at Pulkowa. Subsequently the same thing was noticed again, and it was at the same time with an earthquake in Central Asia.

A ONE-WHEELED velocipede design has been shown to us by Mr. A. Frick, the inventor, who thinks that the motion of the machine as he has it arranged will make the machine self-balancing, longitudinally as well as laterally. Unreasonable as this appears, we understand it to be his intention to test the matter by the construction of a one-wheeled velocipede.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Dreyfus' Patent Self-Oiler.

This invention, represented in the engraving, is one of the best illustrations that we have seen for some time of the benefits, and the easy triumphs of invention as well as of the substantial rewards attending the carrying out of a "good idea." Dreyfus' patent oiler is simply an air-tight, glass oil box, having a hole in the bottom, which is nearly filled by the wire rod seen rising up in the middle in the engraving. The lower end of the rod rests on the revolving shaft of any piece of machinery to which it is applied. The slight disturbance of the rod given by the motion of the machinery causes the air to find its way up into the oil box, through the oil, and to let down the same, consequently, as fast as it may be desired.



The ordinary method of oiling machinery is to pour oil on the journal by means of an oiling can. Oiling in that manner must be very frequently repeated, necessitating considerable labor, and much of the oil flows off at once. Another method is to pour it into a little stationary funnel; but as there is no vacuum to hold back the oil, it flows through too fast, and runs to waste. Dreyfus' oiler saves 75 to 90 per cent. of the oil ordinarily required. The size seen in the engraving, filled with oil, will not run empty in a month. It is applicable to any common bearing, and prevents both heating and freezing of the oil. The wire is regulated inside the tube to feed according to the demands, and there is no flow of oil whatever while the machinery is not in motion. It is reliable in winter, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum.

The agent for the Pacific Coast is Wilkie Darling, Esq., No. 629 Washington street. For further particulars, see advertisement in another column.

THE WELCOME RAIN.—Most welcome to the people of California has been the warm and gentle rains of the past week. A feverish anxiety had begun to manifest itself, lest the drouth of the previous weeks should have been continued for a length of time which would have proved detrimental, if not destructive, to our grain crops. All anxiety is now happily dispelled. The rain has been general over all the agricultural lands of the State, while a small quantity of snow has fallen in the Sierra and over the more elevated regions, as far east as Salt Lake. Croakers and grain speculators are the only parties who do not welcome this refreshing visitation of Providence. The latter, who had hoped to realize high prices for flour in consequence of the failure of the present crops, are now, happily for the masses of the people, disappointed in their expectations. If those who are still holding grain and demanding New York and Liverpool prices, will send it forward by some of the tonnage now in port and waiting anxiously for freights, at such prices as the markets will actually warrant, they will doubtless find the operation greatly to their own profit, and highly beneficial to the general commercial interests of the coast. The present assurance of abundant crops will also tell largely upon the overland emigration for the coming summer, as a failure in that direction would have gone greatly against us with the transient thousands who will visit us during that time, and would also have deterred many others from coming at all, who had made up their minds to embrace the opening of the overland road as a favorable time to transfer their residences to the Pacific Coast.

SNOW ON THE CENTRAL PACIFIC.—It is gratifying to Californians to observe that the delays from snow on the overland railroad, the past winter, have been almost exclusively confined to the Eastern division. Many doubts have been expressed as to the stability of the "snow sheds;" but the experience of the past winter has settled that question most satisfactorily. A few imperfections, which were revealed a year ago, have been promptly attended to during the summer, and the modifications have proved all sufficient. The company has now about twenty miles of sheds; some ten miles more will be required to span the snow belt, all of which will be constructed during the coming summer. It is the determination of the Central Pacific Company to keep their road as free for the passage of trains in winter as in summer, and we trust for the benefit of both companies and for the public that the Union Pacific will exhibit an equal degree of foresight and enterprise.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press.

The Johnston Brandy Distillation Process—The Aroma and Fusil Oil.

San Francisco, March 1st, 1869.

Editors Press:—My attention has been called to an article in your valuable paper of the 20th of February, as follows:

"The Johnston Still substitutes a column rectifier between the still and the worm, in which the spirit as distilled is frequently washed with water before condensation, and the fusil oil thereby thoroughly extracted. A small sample sent us, which was distilled by Mr. Bugby, though 35 per cent. above proof, possessed an unusual smoothness for its age, with a delicious perfume and flavor of the grape from which it was made."

In the first place, I would remark that a column still is not a very recent invention. It has been used in England and France for some years. I have several diagrams in my possession, such as are used in France, invented by one Gantheir Vellars. The most celebrated cognac distilleries of France do not favor the use of column stills for the manufacture of brandy; they adhere to the old style of still. The column still is better adapted to the manufacture of neutral spirits and alcohol. They rectify the spirit too high to retain much of the aroma and boquet of the grape.

My object is not to condemn the column still; but the statement that brandy distilled by it has all the fusil oil extracted, and yet the brandy possessing all of the perfume and flavor of the grape, is an error too apparent for any one acquainted with the chemistry of liquors to credit. The flavor of brandy is due to the fusil oil it contains. Dispossess it of this oil, and you have a flavorless spirit called pan spirit, neutral spirit, or alcohol.

Dr. Ure, the great English chemist, says brandy is the name given in this country to ardent spirits distilled from wine, and possessed of a peculiar flavor due to a minute portion of a peculiar volatile oil. The most celebrated of the French brandies—those of Cognac and Armaquac—are slightly rectified, to only from 0.935 to 0.922; they contain more than half their weight of water, and come over, therefore, highly charged with the fragrant essential oil of the husk of the grape. I will here state that 0.935 and 0.922 refers to the specific gravity, and has the strength respectively of 50 per cent. by volume or 42 by weight for the former, and 56 per cent. by volume or 48 by weight for the latter. You will perceive that the greater the specific gravity, the weaker the spirit is. Absolute alcohol has a specific gravity of 0.794.

J. D. T.

Origin of the Washoe Pan Process.

Editors Press:—In your last week's issue you stated that Mr. Almarin B. Paul first introduced the "Washoe Pan Process." Permit me to say that this is an error. It is true that that gentleman brought pans for amalgamation to Washoe in 1860 or 1861, but pans for amalgamating purposes had for eight years previous, at least, been as plentiful as blackberries in this State.

What is known as the Washoe Pan Process, was first introduced by the late Captain Hatch, at Col. Trench's mill, in Silver City, about the same time as that above mentioned, and was then known as the "Hatch Process."

Captain Hatch having carefully observed the working of similar processes, during a lengthened stay in Mexico, studied the subject, and first introduced substantially the same process in Washoe, but with some modifications and alterations.

About the end of the 16th century, Alonzo Barba, a priest of the city of Potosi, in South America, a man of inquiring mind and undeniable industry, originally discovered and perfected this method. Two hundred years later it was introduced into Europe, and it was the origin of the Freiberg Process.

The ores best adapted for this process are chlorides, bromides, iodides, iodio-bromides, oxides, and some sulphurets of silver, native silver and amalgam.

Its *advantage* is the production of a very pure silver in a shorter time than by any previously known process. The loss of quicksilver, where carefully attended to, is not greater than in the barrel process.

Its *disadvantage* is the heavy loss of silver in *mixed* ores; compound sulphurets, arsenides, etc., not being decomposed, are only recoverable from the "polvillos" or concentrated tailings.

The method of working is this: The pulverized ore is boiled with a solution of common salt in a copper vessel, or wooden vessel with copper bottom, the mixture being constantly stirred; quicksilver is gradually added; gentle ebullition is maintained for some time longer, and the amalgam washed and strained as usual. Where cupreous pyrites are not present, it is advisable to add during the operation, sulphate of copper, or its equivalent.

Thus there is nothing *new* in the Washoe Pan Process, save its introduction here, and that is due, as I have mentioned, to Captain Hatch. "Let justice be done, though the heavens (and some folk's pretensions) fall." This claiming by individuals of the discovery of old, though not generally known methods, is about played out.

J. S.

Railroad Items.

Utah Annexed.—It was on the 18th inst. that the Union Pacific tracklayers and the locomotive and advance cars hove in sight of Ogden. The welcome given them, the enthusiam manifested on all hands in an impromptu meeting, the running up of the United States flag by Col. Dan. Gamble to the strains of the Star Spangled Banner, presented a scene that must become historical, for the Mormons themselves participated. With a characteristic military-like brevity, the chief railroad builders, Warren, of the Utah Division, and Captain Clayton, the tracklayer, though greeted with all the honors, and loudly called upon to make speeches, both declined to detract in that manner from the eloquence of the event, the greatness of which lies so significantly in action, not words.

Salt Lake City Branch and Rival Metropolis.—J. W. Fox, Territorial Surveyor, and J. A. Young, left Salt Lake City, March 9th, to ascertain the feasibility of taking the branch railway between this city and Ogden from Haight's Bench to Farmington Bottom, and from Ogden Bottom on to Wilson Bench. This project is called "Brigham's Grand Coöperative Bulls'-Eye Railroad Company," by the Salt Lake *Reporter*, which says the Mormon organizer has not yet obtained the right of way from the United States. For several days after the departure of the surveyors, there was, says the *Reporter*, "a great rush to Bear River crossing, north, the great attraction being corner lots and good business locations in the new town which the railroad company, it is said, will soon lay off in that vicinity. It is confidently expected that the site of the great commercial metropolis of the Rocky Mountains will soon be determined upon. We are informed that it is extremely difficult to obtain passage in the stages, as enough persons have hooked themselves to load the coaches during the next two or three days."

Sacramento as a Railroad Center.—Sacramento is in semi-daily railroad communication with San Francisco on the west, Folsom and the Cosumnes on the east, with all points on the line of the Central Pacific Railroad, in daily communication with Marysville, and with San Francisco by steamers running to all points on the Sacramento River as far as Red Bluff.

The Rocky Mountain Snows.—A month's blockade on the Union Pacific, which seems to continue still, has lowered "stock" on that road, and furnishes the newspapers with a good text to write about southern routes. Though Durant has exhibited very remarkable energy in getting the Union Pacific road completed to Salt Lake, notwithstanding these difficulties, in winter, he falls far short of the excellent administration of the running management on the Central Pacific, where accidents and detentions in loftier and more difficult mountains, are scarcely heard of. Numbers of passengers on the Union Pacific are said to leave the railroad and proceed on foot. The Union Pacific snow-plow is 200 feet long, 10 feet wide, and about 11 feet high, four feet of the front flat running three inches above the rails, and then two molds, similar to the molds of a plow, form to a point within four feet of the front, which, when running at the rate of thirty-five to forty miles an hour, often throws the snow over the telegraph wires.

Central and Union Pacific.—The Union Pacific is finished to Ogden. The Central Pacific is finished to within about ninety miles of Monument Point, or the north end of Salt Lake—leaving about 170 miles of the continental railroad uncompleted. To reach Monument Point, the Union Pacific has about eighty miles of track to lay. The Central Pacific is laying three miles one day and four and a half the next; the difference being caused by an extra train of material coming forward on alternate days. The Central has its grading completed to Monument Point.

The Virginia City Railroad.—The *Herald* of March 15th says: Work is being vigorously prosecuted on the first section of the Virginia and Truckee Railroad, and the road from Carson or Empire to Virginia, will be completed and in running order by December next. Thereafter the most of the coarser grades of ore will be taken to mills on the Carson for working; and so soon as the road is extended to Washoe and the Truckee, the probabilities are that there will be but little mill work done in Storey County. But employment in Virginia, Gold Hill, American Flat and Flowery, will be afforded to three or four thousand more miners than the number now engaged.

Oroville and Virginia City Railroad. We learn from Chief Engineer Stangrooms, who passed through this city yesterday, says the Marysville *Appeal* of March 12th, that ground will be broken immediately on the Oroville and Virginia City Railroad. Work will be commenced as soon as a laboring gang can be organized, near Oroville, and it is hoped that it means work, not show. We understand that the preliminary survey, which was completed some time ago, will be adopted with slight variations. There have been so many suspicions raised against this road that it will require straightforward work to regain confidence sufficient to satisfy the people that it is a *bona fide* railroad building.

Western Pacific.—The *Bee* says that this road, from the turn it makes at Brighton, five miles east of Sacramento, is as straight as an arrow to the Cosumnes and beyond it all the way to Stockton, and almost as level as the surface of a lake. Forty miles per hour can be made on it all the way to San Francisco with ease. It is substantially constructed, the sleepers being heavy and close, the rails 65-lb iron, fastened together by the Fish joint. At present a daily train runs to the Cosumnes, a distance of eighteen miles from Sacramento, but the road is not yet ballasted. The intention is to make this the best piece of running road on the continent for time, if steam and skill can do it, and it is to bring San Francisco and Sacramento nearer to each other than they have yet been.

Stockton and Tejon Pass Railroad.—Mr. Cole has introduced a bill in Congress granting lands to aid in the construction of a railroad from Stockton to connect with the Southern Pacific Railroad near Tejon Pass. It authorizes the construction of the road by the Stockton and Tulare and the Sycamore Bend and Tejon Pass Companies conjointly, and besides the right of way, etc., grants ten alternate sections of unoccupied, non-mineral lands per mile on each side of the line. The bill will not be acted on this session and must be revived in the next Congress.

Stockton and Tulare Railroad.—The Stockton *Independent* of the 10th inst., intimates that "some new light has dawned" in regard to this enterprise, and that the plans of the directors were about to take definite shape, and their immediate intentions be made known. On the evening of that day, at a railroad meeting held in the City Hall, Messrs. Gray and Peters, two of the trustees of the company, stated that iron and ties for the road had been purchased, and that the iron is now on the way from the East. The company have secured a line for the road to the Stanislaus River, and have set their grade stakes for twelve miles from town. They are, however, not receiving such encouragement from the citizens of Stockton in the way of subscriptions to the stock as they expected, and as they think they have a right to demand. The original incorporators of the road consisted of ten men, who each subscribed $10,000, making $100,000. In addition to this, the citizens of Stockton subscribed $49,000, and thus the total subscription to the stock is now but $149,000, a sum insufficient if all in the hands of the company, to complete the road for twenty miles from the city this season.

Dr. Holden, President of the Stockton and Copperopolis Railroad Co., has issued a neat little pamplet of fourteen pages, in which he sets forth the advantages to be derived from the building of the road, and presents some elaborate statistics concerning the resources of San Joaquin, Calaveras, Alpine, Tuolumne, Mono, and Stanislaus counties.

The Oregon Road is working its way down to the California line, *via* Umpqua and Rogue River valleys. The surveyors and graders are now at work in the Umpqua valley, near Oakland, and it is expected the road will enter the Rogue River valley in the vicinity of Table Rock, near Rogue River. It will strike the Klamath probably at Bogus. The Yreka *Journal* says: Yreka is the most central point on the direct route of the railroad and depot for Scott Valley and Klamath, Del Norte and Trinity counties, and will also be the most central depot for all the Klamath Lake country business between this place and Surprise Valley. The road will run from Red Bluff up the Sacramento river to within a few miles of Shasta, thence to Soda Springs, thence through Shasta Valley to Yreka, following out the Oregon road to Bogus, probably through Hawkinsville.

The Oregon East and West Side roads are in Congress, vigorously contending for the land grant made to Oregon by act of 1866. Delay in the construction of the Oregon and California road, will be the only result, so far as the public are interested.

The citizens of Pacheco, Contra Costa Co., held a meeting on Monday, March 8th, with a view to the construction of a Tram, or Railroad, to deep water, near Bull's Head. The project was determined upon, in a decisive manner.

A railroad has been surveyed from the Soquel Landing, several miles up the Soquel Creek. A company is in course of organization, with $50,000 capital, for the burning of lime. Rumor says the money men are talking strongly of erecting an elevator on the beach.—*Sentinel*, March 6.

Berkley College Horse Railroad.—The Oakland Horse Railroad Company have received the material to complete their road from the foot of Broadway, Oakland, to Temescal Creek. As soon as the college buildings are completed at Berkley, the road will be completed to that place.

Branch to Vacaville.—The citizens of Vacaville are about building a branch railroad from that place to connect with the California Pacific. This will make Vacaville an important grain and fruit depot.

The San Lorenzo horse railroad, now mostly graded, will open up the lumber region on the upper San Lorenzo, now unavailable through lack of transportation.

The Patent System in Germany.—The Prussian Government has made the proposition to the North German Confederacy to abolish the system of protecting any specific industry by granting a patent to the inventor, and it is very probable that the North German Reichsrath will concur in the views of the presiding Government. In Germany the patent system has not proved productive of any of the beneficial results for which it was originally established. It neither stimulated inventive genius to a noteworthy extent, nor has it proved advantageous to the public in general. Even the patentees themselves complain that the character of a patented invention did not materially augment their profits above what they would have realized as the original manufacturers of a patented article. On the other hand, the proportion of patents granted, for instance, in Prussia, is not quite one-ninth of those granted in the United States; the examination of any new method or contrivance for which a patent is claimed being so scrupulous in Prussia, that 87 per cent. of all applications is rejected. The abolition of a patent system, therefore, is an infinitely smaller affair in Prussia than it would be here, where immense fortunes are realized in consequence of it, and innumerable trades established on the perpetuity of the present system. *Ex.*

The Weight of Hydrogen.—The lightest substance in nature is hydrogen. The next lightest is marsh gas. But that is as much heavier than hydrogen as iron is heavier than water. Some idea of the extreme lightness of hydrogen may thus be arrived at.

New Photographic Paper.—The new paper of Messrs. Shaeffner & Mohr is sensitized by carbonate of silver. Ammoniacal vapor is used as the reducing agent.

Mechanical.

THE SMALLEST STEAM ENGINE IN THE WORLD.—A writer in a London periodical thus describes a minute model of the engines of the steamship Warrior,—made by Thomas Smith: "This tiniest working model in the world is now in the possession of John Penn (of Greenwich), the eminent maker of the great engines of which it is the infinitely reduced counterpart. It will stand on a threepenny-piece; it really covers less space, for its base-plate measures only 3-8th of an inch by about 3-10th. The engines are of the trunk form introduced by Penn; the cylinders measure 1-8th of an inch diameter, and the trunk 1-20th. The length of stroke is 3-40th of an inch. They are fitted with reversing gear, and are generally similar in design to the great machines with which ships of the Warrior class are equipped. From the extreme smallness of this model a few minutæ—such, for instance, as the air pumps—have necessarily been omitted; there is a limit beyond which human skill and minuteness cannot pass. Still, so small are some of the parts that they require a powerful magnifying glass to see their form. The screws which hold the members together are only 1-80th of an inch diameter, and these are all duly furnished with hexagonal nuts, which can be loosened and tightened by a Liliputian spanner. The whole weight of the model is less than a threepenny-piece. It works admirably, and when working its crank-shaft performs from twenty to thirty thousand revolutions in a minute."

HARDENING AND HAMMERING.—*Van Nostrand's Engineering Magazine,* has a translation of an article upon steel from "*Gruner in Annales des Mines.*" The writer attributes the effect produced upon steel by hardening, or by hammering, not to the fact that they facilitate the combination of the carbon with the metal, but that they prevent the separation of these two substances already combined. He says: "The molecules of soft bodies require a certain time for motion." "If the body is suddenly cooled, the carbon cannot isolate itself. In my opinion, hammering causes the same result, because it prevents the iron and the carbon from crystallizing, as it were, separately, in cooling, but forces all parts with great power into and through each other. A proof of the want of harmony in the effects of hardening and hammering lies in the fact that hammering increases, while hardening decreases, the specific gravity of steel."

WOODEN RAILROAD.—The New York *Stockholder* gives part of a letter from the President of the Clifton Iron Co., describing its road as follows: "The rails are of hard maple scantling, 4x6 inches, set on round ties, on which are framed slots 6x4. The rails set on edge and keyed in the slots by two wooden wedges driven against each other, project two inches above the ties. The rails admit of bending sufficiently to make the curves. The ties are laid on the earth and ballasted in the usual manner to two inches of the bottom of the rail. It takes 21,120 feet, board measure, of scantling for a mile, and 1,760 ties at three feet apart. Our road is a very rough one. We have a great deal of trestle-work, some of it over thirty feet high, which is vastly more expensive than a level route. The engines used weigh from ten to fourteen tons. The rails will probably last about five or six years. An engine will move about thirty tons of freight at about six to eight miles an hour, with heavy grades and sharp curves. The company expects to move over the road next year from 50,000 to 100,000 tons freight. Trains have passed over the road, light, at the rate of twenty miles an hour; but this would not do for freight."

HEATING AND COOLING SURFACE.—The heat-transmitting power of boiler surface varies as the square of the difference of temperature between its opposite sides; and it has been found experimentally that a square foot of *freely exposed* cooling surface (such as that of the main steam pipe) has about one-fifth of the heat transmitting power of the heating surface, on an average; or supposing that in a given boiler the areas of heating and cooling surface are equal (which is very seldom the case, however), the effect of the latter, if freely exposed,—that is, not properly lagged,—would be to reduce the evaporative efficiency of the boiler twenty per cent.—*Artisan.*

NEW PROCESS IN ELECTRO-METALLURGY. The *Mechanics' Magazine* describes an improvement, recently patented, by which silver is directly deposited upon iron and steel surfaces, without an intermediate coating of some other metal, as has heretofore been thought necessary: "The surface of the iron is purified by nascent hydrogen, the hydrogen being produced by the electrolysis of hydrate of potash and soda. With care no other salt need be added to this solution, but in manufacture it is expedient to add a small quantity of one of the compound cyanides; those preferred are the nickelo or cobalti-cyanides of potash. If care be not taken to regulate the current of electricity according to the strength of the solution and the number of articles in it, as well as the heat of the solution, sodium will be deposited on the articles as well as hydrogen, and if transferred to the silver solution with that on, the silver will not adhere. The compound cyanide prevents that. When the article is coated with silver it is subjected to a heat of between 400° and 500° Fah., so as to fix the silver, and after that it will stand a red heat without injuring the coating. Knife-blades and all cutting instruments are silvered at a pale straw temper, so that the burning in or fixing of the silver may bring them down just to a proper cutting temper.

ENAMELING OF IRON VESSELS.—The usual method of coating iron vessels has been by sprinkling a fusible enamel, in powder, over the highly heated surface. But this coat will not withstand acids. A new French process is thus described: The metallic surface is brought in contact with the ingredients of ordinary white glass, and heated to vitrification; the iron is said to oxidize by combination with silicic acid, and the glass thus forms one compact body with the metal. The coating of enamel may be laid on as thinly or as thickly as desired. Experiments are being made in coating the armor plates for ships in this manner.

TEMPERING TAPS.—George Jones sends the following to the *Scientific American:* "Most of your readers are aware of the difficulty in tempering taps and reamers without springing, especially long and large ones. To accomplish this let the blacksmith select his steel for the job and forge the tap with a little more than the usual allowance, being careful not to heat too hot, nor to hammer too cold. After the tap or reamer is forged, heat it and hold it on one end upon the anvil. If a large one hit it with the sledge, if a small one the hammer will do. During this operation the tap will give away on its weakest side and become bent. Do not attempt to straighten it. On finishing and hardening the tap it will become perfectly straight. If any are doubtful a simple trial will convince them."

METALLIC CEILINGS.—A system of metallic ceilings, which consists in the application to the joisting of very thin stamped metal, in ornamental embossed panels, has lately been invented. These stamped panels are fitted for every kind of decoration in color, and if inserted as plain surfaces, may be used for the ground for every description of cartoon painting, combining with lightness and durability, artistic and ornamental effect, at a comparatively small cost.

AN OLD PLAN REVIVED.—A steam driving-wheel for canal boats is being adopted on the Erie canal, constructed upon an old-fashioned plan. It is placed in the middle of the boat, and rolls on the bottom of the canal, being armed with spikes to give it a firm hold. It is so arranged as to rise and fall, and thus accommodates itself to the uneven bottom. The speed attained is two or three miles an hour.

WHAT IS STEEL?—Pig iron, the raw product of the reduction of the ore, may be hardened when chilled quickly. Wrought iron is malleable either cold or hot, but cannot be hardened. Steel may be hardened, although malleable. There is a continuous line of products in iron manufacture, from the lowest to the highest; each merging into the next. It is not an easy matter, therefore, to draw the line distinctly, and answer the question, "what is steel?"

Scientific Miscellany.

THE HADROSAURUS.—A huge reptile, 25 feet long, and 14½ high, with a tail 12 feet in length, has been restored by Professor Hawkins, and was exhibited before the American Institute in New York, on January 27th. Portions of the skeleton were found at Haddonfield, New Jersey, and the parts which were wanting were supplied after many months of study, by Professor Hawkins. It was first described by Joseph Leidy, of Philadelphia, who named it the *Hadrosaurus Foulkii,* in honor of W. P. Foulke, of the same city, through whose efforts it was exhumed; he having employed men expressly to search, in consequence of the report of the discovery of a number of large vertebræ, some twenty years since, at the spot in question. The bones were found at a depth of nine feet, imbedded in a stratum of tenacious bluish black micaceous clay, in association with a multitude of shells, an echinoderm, several small teeth and vertebræ of fishes, a coprolite, and some fossilized coniferous wood. Mr. Leidy considers this enormous reptile to be allied to the Iguanodon. It will be placed in the Central Park, together with the remains found with it, in a special saloon to be prepared for the purpose.

DISTILLATION OF HYDROCARBONS UNDER PRESSURE.—In *Silliman's Journal* for Jan., S. F. Peckham gives the result of some experiments made by him in the distillation of California hydrocarbons for the State Geological Survey. The volume of Reports of that Survey on "Economical Geology," containing these results, is,—he says,—"now ready for the press, but its publication is delayed by the failure of the last California Legislature in making the necessary appropriation." The yield of illuminating oil from these dense petroleums, is by the ordinary method of distillation very small, but when by distillation under pressure, they are subjected to what is technically termed "cracking,"—it is largely increased. With a pressure of between thirty and forty pounds to the square inch, a percentage of illuminating oil as high as 60 was obtained by him from crude material which yielded only 20 per cent. by the ordinary method.

HYDROGEN.—When the announcement of the recent experiments of Professor Graham upon the metallic nature of hydrogen was made before the French Academy, M. Wurtz reminded that body that he discovered a compound of copper and hydrogen twenty years ago. This compound was $Cu^2 H$, and was a result of treating sulphate of copper by hypophosphorous acid. With other metals he failed, *except with palladium;* the chloride of which, treated with the same acid, gave a *hydruret* of palladium, in powder; but as it soon gave off its hydrogen, he neglected to record the fact.

OPALS.—At a meeting of the Lyceum of Natural History, in New York, January 18th, the subject of opals was introduced. Professor Eggleston, of the School of Mines, stated there were two kinds of opal, the Mexican, or soft opal, and the precious opal, which retained its luster for a century. He had noticed a curious property of these stones, viz: that the Mexican opal showed its "fire" according to the dampness of the season, being dull in dry weather. The effect of putting a drop of water on the stone was to make it quite iridescent. The peculiar appearance of the stone was caused by the decomposition of light in its microscopic fissures. He was not prepared to state what effect the action of the water had on this decomposition. It was certain it had some. In fact, he considered it indubitable that the opalescence, under the circumstances he mentioned, was caused by hydration. In the precious opal the fire was lost by handling. He had been engaged on some experiments to ascertain how it might be restored. Heating would not do. He had found alkaline solutions useful in restoring it. He had used cyanide of ammonia with good effect.

NEW FORM OF PERMANENT MAGNET.—Frederick A. Paget, C. E., communicates to the *Philosophical Magazine,* an article upon artificial magnets, from which we extract the following:

"Without any distinctly given reason, it is taken for granted in all works on magnetism, and in all the practical applications of mechanism, that it is impossible to magnetize a plate except in the direction of its greatest length. Dr. Lamont, in a paper communicated to the *Philosophical Magazine,* for November, 1861, by the Astronomer Royal, investigated the question of the most advantageous form of magnets. In all the forms he experimented upon the breadth was always less than one-third the length, and generally about one-fifth, and he does not seem to contemplate the possibility of magnetizing a square plate, and still less an oblong plate, in a direction transverse to its greatest length. Now I find that by cutting slits nearly up to the middle of a steel plate, a square plate in one piece can with such slits be regularly magnetized, and by this means even an oblong square plate can be regularly magnetized, and with as many poles as may be required in a direction transverse to its greatest length. I herewith forward a square plate magnetized in this way. It is of watch-spring steel, 0·0075in. thick, and ⅞in. + ⅞in., it has four pairs of slits ¼in. wide cut from its edges, and leaving a central web ¼in. wide uniting the whole. On moving a small needle round this square plate it is seen to be regularly magnetized, and on sprinkling iron filings on the magnet, covered by a sheet of paper, they arrange themselves in lines, proving that the magnet really consists of a number of small regular similar magnets, arranged below each other in the same vertical plane. On suspending an oblong magnet of this kind, with its longer axis in the vertical plane, the needles set themselves to the magnetic meridian; on suspending it flatwise, with its longer axis in the horizontal plane, the longer axis points east and west. As well as can be judged by subjecting them to slight shocks, the magnets are as permanently magnetized as if they were separate from each other. Only time can prove whether they will lose their magnetism."

CORRELATIONS OF ELECTRICAL FORCE.—D. G. Fitz-Gerald, in *The Engineer,* in the course of a demonstration in reference to the calorific and dynamic equivalents of electricity, states the general law "which has been verified in the case of most other metallic elements, and which probably applies to all elementary bodies, with the exception of oxygen, viz: that 'an equivalent of any element, in combining with a given body electro-negative to it, liberates the same quantity of electricity.' What, in fact,—he says,—is termed the 'chemical equivalent,' 'equivalent weight,' or 'combining proportion' of a body, in contradistinction to its 'atomic weight,' 'is that weight which is associated with, or which by combination evolves a constant quantity of electricity. Equivalents of platinum, copper, zinc, and potassium, are of very different value as electromotors, yet they are each combined, in their metallic state, with the same quantity of electricity. The value of a metal as an electromotor, or positive element of a voltaic couple, is, theoretically, and also generally speaking, commercially, proportionate, not to the quantity of electricity associated with a given weight, but to the quotient of the calorific equivalent by the atomic weight; in other words, this value, for an equivalent of any metal, is as the calorific equivalent. The practical value of an electromotor is in fact its capacity to produce, not electricity, but electrical effect or work; and the dynamical or calorifical value of any quantity of electricity is as the quantity of energy stored up in it, or the electrical force which we have to correlate with the various other modes of force."

BAROMETRIC FLUCTUATIONS.—At a recent lecture upon the barometer, before the American Institute, by Professor Guyot, he stated that there was a yearly, monthly, daily and even hourly fluctuation, the tidal wave of the atmosphere rising highest in the morning about nine o'clock, then falling, rising again in the evening, till about ten o'clock, and again falling during the night, the difference between the maximum and the minimum being about two hundredths of an inch. The regular variations might be called great tides, the irregular variations the tidal waves, the barometer falling and rising all the time, a stationary condition being very rare. These irregular variations predominate in our latitudes, but die out gradually as we approach the tropics.

White Pine Items.

By a private letter from Shermantown, or Silver Springs, dated March 11th, we are informed that the weather in that sheltered spot has been severe for only a day in the conrse of the winter; that building is progressing as fast as lumber can he obtained; that every stone in the country is about to be overturned, people arriving at White Pine by thousauds; that there are two quartz mills, two smelting works, and a sawmill at Shermantown. One of the smelting works was to start shortly, and the other was "trying experimeuts." The mills are running night and day; two more are in progress of huilding, and there is obtainable ore enough for about fifteeu mills.

THE White Pine excitement is on the increase as spring approaches. The stages in Nevada are said to be crowded every day and passengers booked a week ahead. * * Mr. Oscar, of Virginia City, who returned from White Pine on the 15th, says that he found the road betweeu Hamilton and Elko completely lined with adventurers, rushiug out to the "poor man's paradise"—some in coaches, some on horseback and some on foot, with their blankets on their backs. A few men have arrived from the Atlantic States. * * The Portland *Oregonian* of the 6th, says: There is a great deal of talk in this city about going to the White Pine mines, and we learn that a similar state of things exists up the valley, especially in the various towns. A good many will doubtless go from Oregon iu the course of the season. * * On the 12th inst. five plucky Frenchmen from California passed through Anstin, packing their blankets, baggage and grub, on their way to White Pine. By the time they had crossed the mountains they were out of money, so they stopped at Carson three weeks to earn euough to carry them through.

On the shady side of the question, Dr. C. C. Green, of Virginia City, writes: You no doubt hear men saying that White Pine will far surpass Virginia in point of wealth and greatness as a mining region, but it is my opinion, after a careful examination of the country, that there is not enongh ore in sight, or even in prospect, to keep the present population in bread and whisky for the next two years, to say nothing of the thonsands who are preparing to come next spriug. That the ores of this district are of a very high grade cannot of course be denied; but the quantity of ore to sustain a large mining population is not here. Mines, or what are called mines, are not numbered by hundreds, but by thousands, and the ore taken out is not computed by tons, as in Virginia, but by pounds. Every man you meet is a millionaire in his own estimation—and is on the sell.

ALBERT S. EVANS writes to the *Alta*, dated March 13th: A rich strike was made in the Phœnix mine, on Chloride Flat, yesterday, and similar developments are being msde in other claims in the vicinity. The finest ores I have yet seen, outside of the Eberhardt, was taken a day or two since from tbe Colleen Bawn (a private claim), ou Bromide Flat. It is almost solid silver. The workmen in the Governor Bross (square location), on the same flat, last evening, blasted through the limestone into the spar and "got the color" at once. They think they are nearly down iuto the main deposit of rich ore, which is known to run through their gravel.

PILGRIM, tbe *Bulletin* correspondent, says of the Eberhardt: There are strata pockets of chloride which will run from $1,000 to $20,000. There are horses of limestone and spar in the vein the size of the old *Bulletin* office, and encircling these are rich chloride shells. The south wall is rough and not well defined, and pitches slightly towards the north or foot wall. Such was the case with the Comstock, and after goiug down it turned parallel with tbe other.

Of the Keystone, now consolidated with the Eberhardt, he says: The north wall is as smooth as polished marble the entire distance, and as true and straight as a bee line. Every miner who has seen it pronounces it the most perfect and truest foot wall in this State. It has about an inch of soft clayey substance common to most fissure veins. It is 183 feet between the walls. The hanging wall will undoubtedly turn a few feet down and dip parallel with the foot wall. We estimated that there is in sight, making liberal allowances for horses and waste, at least $8,000,000.

THERE are recorded in White Pine District at the present time over 3,000 claims.

T. CAHILL & BRO., the assayers, have made over 1,300 assays, running from nothing as high as $21,000. A great many run as high as $5,000. The average of all the assays is $130.

THE late Base Range discoveries have turned out very ordinarily. Half a dozen men only are left on the flat at work opening a claim or two. The crowd has dispersed—gone, our informant says, "Heaven knows whither."

ON the 11th inst., the air was warm, says the *Alta* correspondent, as it usually is at this season in the Bay City, say 60° to 65°, and the snow fast disappearing. It has, in fact, already left all the exposed hillsides and slopes, and even on the northern slopes it is growing thin. Prospecting is consequently going on with a "perfect looseness," and everybody having aspirations that way is off with pick and shovel. At the rate that this work is going on the whole country will soon be prospected from the Humboldt to the Colorado. Later dispatches says that it is again snowing.

THE same correspondent says further observation has confirmed his belief in the existence of a continuous ledge running from the Hidden Treasure northwestward along the western side of Treasure Hill down to a point just west of Hamilton, in the vicinity of the Featherstone, Echo, and Excelsior mines, for a distance of two miles and a half.

BEACH & HENDERSON have left Los Angeles with a flock of sheep for White Pine.

POCOTILLO is the name of a new town site on the slopes of Treasure Hill, where lots are advertised for sale.

GREENVILLE is the name of another prospective rival of Treasure City. It is being laid out on the strength caused by rich discoveries in the Base Metal Range.

SPEAKING of the developments of Treasure Hill, the editor of the White Pine *News*, (we recognize the able pen of Myron Angel) writes: Whether its prototype in history is known or not, we cannot at present tell, but the nearest like it, in its discovery, isolation, wealth and character, seems to be the great peak of Potosi in South America. That lofty peak of the Andes, described as reaching some 13,000 feet into the sky, is, from where it rises above the surrounding mountain gorges or valley, some ten miles in circumference, and its silver, as every school-boy knows, was discovered by an Indian, who, in pursuit of a goat up the precipitous, rocky sides, grasped a bush to aid him in his ascent, and this giving way at the roots, exposed some glittering silver beneath. This was several centuries ago, and since then countless millions of the precious metal have been extracted from that single mountain, until it is but a honey-combed shell, and it is not yet exhausted of its treasure. Treasure Hill is isolated like Potosi, is of similar formation, of equal size, or perhaps a little larger at the base and not quite so high; its mines are of Indian discovery, and its future promises equal brilliancy, and equal if not superior in wealth. Two years since, a degraded and starving Indian carried to a camp of miners a piece of the ore from the locality of the Hidden Treasure mine, and this led to the exposure of the wealth of Treasure Hill. In the explorations following, quantities of pure silver were found where trees had fallen and burned, or where the Indians had built fires on the beds of chloride ore, reducing the easily smelted rock. Such discoveries, made in different localities, created a wonderful excitement, and plainly indicate our unexampled wealth. Following the discovery of the ore which crowned the summit, came the discovery of the great Eberhardt deposit, or vein; then those of Chloride Flat, Pogonip, Sunny Side and the "Base Range," all most surprising in their wonderful richness. The geological formation of the mountain is as singular as its riches are rare. It is an isolated peak of fossilliferous limestone, overlying silurian rocks at a great depth, and these having a foundation on others of more primitive age. Into the crevices, caves and chasms of the limestone, or in displacements occasioned by the action of thermal waters rising from the primitive and silurian rocks, were deposited the lime, silica, spar and ores which now constitute the mines and veins of the hill. By such process of change has been formed that singular feature of mineralogy—fossilliferous quartz. The limestone has been carried away by the action of the water, while all its features, the form and character of its fossils, have been preserved in the obtruding silica. These crevices, chasms, caves or displacements, are in every portion of the hill, and of every size, from that of a bull's eye to that of the mammoth chasm of the Eberhardt.

GREAT competition between the Pacific Union and Wells, Fargo & Co. Express Companies, reduces the present running time between Elko and Treasure City to 18 hours. Mr. Grim, President of the Pacific Union Express, thinks of running a pony express from Elko.

MUCH lumber is still being shipped to White Pine from the Carson and Truckee mills. It commands a more ready sale in that region than any other article.

THE weather being fine, writes Mr. Jack White to the Gold Hill *News*, and the snow disappearing rapidly, nearly everybody is out during the day prospecting. In the evening the saloons are crowded and the faro, keno and monte tables do a thriving business.

PLENTY of White Pine stock is for sale in San Francisco—offices having been opened, the mining secretaries flourishing again, and newspapers containing advertisements accompanied by special notices indicating the road to fortune.

California Academy of Sciences.

A regular meeting of the Academy was held on Monday evening, March 15th., the President, Dr. Blake, in the chair. Dr. Spencer, of San José, was elected a resident member.

ARTESIAN WELL BORING IN SAN FRANCISCO.

Gregory Yale presented a specimen of copper pyrites taken from the artesian well boring at Francis & Valentine's establishment, on Commercial street, at a depth of 208 feet. It was found not in a regular stratum, but in a drift intermingled with pieces of flint and pebbles, showing the drift of a subterranean stream. Some specimens of shell and wood were also brought up from the well. The water had come up to within fifteen feet of the sidewalk.

Dr. Blake remarked that other attempts had been failures; that in one instance a stratum of rock was encountered which was bored through some forty feet, when no water appearing the project was abandoned. The same result attended the attempt to bore an artesian well in Portsmouth Square some years ago, by the city government.

MORE ABOUT THE MEAT SHOWER.

Dr. Cooper having called on Dr. Kellogg for further information on the subject of the shower of meat, Dr. Kellogg remarked that he believed the statement of the witnesses of the phenomenon to be reliable and correct, and read a communication from W. Frank Stewart stating that instances had been known, especially during the drouth of 1863, of flocks of buzzards having gorged themselves with the meat from dead cattle, and then disgorging it upon the plain.

Mr. Bolander stated that Mr. Eloesser desired him to say that instances had been known in Italy of substances falling in this manner, which were mistaken for meat, but which proved to be vegetable matter—a species of fungus resembling decomposed flesh.

Dr. Blake said that the specimens had been carefully examined, and found to be flesh.

THE PETALUMA MASTODON.

Mr. Yale stated that he had corresponded with the discoverer of the skeleton of the mastodon lately found near Petaluma; the bones he said, were being removed and scattered, and the Academy ought to take steps toward preserving the remains. The head had been carried away, and other portions disturbed, but the vertebra were still in position.

Mr. Brooks remarked that the animal was said to have been horned, but that more probably these were tusks.

Dr. Cooper said the animal was probably either an elephant or mastodon, and the tusks had been mistaken for horns.

Mr. Yale said a similar discovery was made last year in the vicinity of the Mission of San José.

Dr. Copper stated that Mr. Hoffman, a member of the society, examined one of these animals discovered in the valley of San José, and that upon being exposed to the air, the tusks crumbled to pieces.

Messrs. Bolander and Yale were understood to agree to serve as a committee on the subject, with the purpose of visiting the spot.

SAN FRANCISCO EXPORTS.—The exports of merchandise from this city during the first half of the present month were $752,852. During the same period for 1867, the merchandise exports were $436,179; and in 1868 they were $569,796. This exhibit shows a most healthy and satisfactory increase.

DEWEY & CO.

U. S. AND FOREIGN

PATENT AGENCY

FOR THE PACIFIC COAST.

Office, No. 414 Clay Street,

SAN FRANCISCO.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

Confidential Advice.

We invite consultation (in person or by mail) regarding new inventions, for which we make no charge. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests guarantee, and the thousands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

Advantages of Our Agency.

Inventors on the Pacific Coast can sign the papers at once, and save at least two months' time in securing patents through our office. When desirable they can visit and give us personal explanations—better than written instructions.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

From long experience in the business, and an intelligent and thorough understanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents*.

We guarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

Information for Inventors,

Printed in circular form, containing list of Government and other fees, sent free.

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and foreign patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

California inventors should beware of placing their inventions and money in the hands of persons not well known as honest, responsible and capable.

Patent Office Reports.

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801 to 1845, and full files of scientific papers containing illustrations and list of U. S. Patent Claims, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

DEWEY & CO.,

414 Clay street, below Sansome, San Francisco.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, March 20, 1869.

Financial.

From the Commercial Herald we take the following:

Since our last issue we have been favored with refreshing showers, which have greatly assured the farming community, and promise to crown their labors with an unprecedented harvest. As we write the pluvial bounties are becoming more copious and appear to extend over a wide field, with every prospect of an abundant supply. On the Sierra Nevadas and east of that range much snow has fallen, clogging the railroads and hindering communication with these districts. The Central Pacific Railroad is so pressed to transport its own effects in order to complete the enterprise at the earliest possible day, that orders have been received here to ship merchandise by the old-fashioned methods. It is unnecessary to explain that so soon as the railroad shall be completed all its available facilities will be placed within reach of the public. Large amounts of Eastern capital are finding their way here for early investment in White Pine mining and real estate stock, and we learn that vigorous efforts will be made to divert the trade of that section and Salt Lake from San Francisco. They must all prove vain, for there is nothing which Chicago or any other Eastern city can supply so cheaply as the Metropolis of the Pacific. Especially is this true in reference to all sorts of groceries, such as salt, spices, sugar, tea, coffee, soap, candles, and the like. In the matter of fruits, silk and woolen goods, lumber, machinery, etc., there can be no competition against us.

The North Pacific Transportation Company filed its certificate of incorporation in the County Clerk's office on the 13th of March. Its capital stock is $5,000,000, divided into 50,000 shares at $100 per share. The Trustees are Jesse Holladay, William Alvord, W. C. Ralston, Loyd Tevis, Alvinza Hayward and S. F. Butterworth. Its objects purport to be the transportation of passengers and freight on the waters of the Pacific ocean and all the rivers and bays accessible from it, and to transact all other business necessary to carry out the design.

The Commissioner of Immigration has obtained a satisfactory settlement of his claims upon various parties who have long contended against the collection of the State tax as being illegal. We understand that the claim against Koopmanschap & Co. was withdrawn on the payment of $20,000 by that firm. This was the last of the lot, with the exception of a claim against the Pacific Mail Company for the tax upon six Chinese, which has, by agreement, been referred to the Courts, to be settled upon the intrinsic merits of the case.

City Stocks.

Increased interest has been manifested in miscellaneous securities, and the sales during the period under review have been very considerable. Spring Valley Water stock sold to the extent of 395 shares at a uniform rate of $68 per share. San Francisco Gas stock was in the market at $78@77 50, and North Beach and Mission Railroad at $72@71 50. A few shares of Sacramento Gas Company stock were disposed of at $95 per share. The annual meeting of stockholders will be held at Wells, Fargo & Co's office, in this city, on the 30th inst. This company has been paying regular monthly dividends of ½ per cent. For California Steam Navigation Company stock 70 per cent. is bid. A dividend of 1 per cent. upon their capital stock was dishursed on the 15th inst. The last previous dividend was paid in October, 1868. The State Telegraph Company also dishursed a dividend of 1 per cent. on the 15th. This is announced as their tri-annual dividend. The last previous dividend was paid in July, 1868, amounting to $1 per share. At the annual meeting of the San Francisco Insurance Company, held on the 16th inst., John Archbald was elected President and R. B. Woodward Vice-President. This company is winding up its business, and these officers were elected in order to legalize the signing over of mortgages, etc., in their possession. The accrued earnings of the assets enables them to disburse a dividend of 2 per cent. per month on the first of April next.

Mining Share Market.

This market has been more or less demoralized since our last reference. Prices have been very generally irregular and fitful, effecting a serious decline in a number of stocks, while others have been barely able to maintain themselves under the strong "bear" pressure which was very observable. This state of things indneed many to let their stocks "slide," while others, who are commencing to operate in White Pine claims, also appear inclined to drop the Washoe line and brace themselves for a vigorous campaign in the new and more exciting speculative struggle soon to be inaugurated in our mining share market. Hundreds of White Pine companies have already been incorporated and additions are daily made to the number. Many have placed their claims in the hands of skillful manipulators, and it will be as well to scrutinize them closely. Non-speculative investers will probably look more to actual developments than verbal reports, and pay more attention to results than to anticipations.

Alpha—receded from $38 to $27 50, improved to $33, and closed at $31 25. On the 17th, the north drift under the east clay, on the 1,030 level, was in 15 feet, and the quartz is reported to look very favorable, but as yet shows no pay. There is a slight increase of water in the face of the drift.

Chollar-Potosi—has been in moderate request, selling at $166@157, and at the close realizing $161. During the week ending March 12th, 844 tons of ore were extracted. In the new tunnel the ore has been stoped for a distance of about 90 feet in length, varying in width from 8 to 20 feet. Up to this date it is reported there are no evidences that this deposit extends much below the tunnel level. In the shaft work was suspended at the 920 level on the 8th inst. The only drift now being run on the lower levels is at the 1,240 station, which extends 129 feet from the incline, and 500 feet east from the shaft. The rock is hard and there are no indications of quartz in any portion of it. On the 16th inst. 110 tons of ore were shipped to custom mills.

Crown Point—opened at $75 50, declined to $71 50, and closed at $71 50. Nothing of importance from the mine so far as we can learn. On the 18th inst. bullion valued at $7,754 49 was send forward from the Rhode Island mill. ....Gould & Curry sold at $100@109 50, and closed at $107 50. Work is now rapidly prosecuted at the bottom of the shaft, with the purpose of soon resuming the further sinking of the shaft.

Hale & Norcross—sold quite largely at an advance, rising to $98 on the 17th, and closing yesterday at $91. They are breasting ont ore on the fourth level, both north and south of the winze, and it is said to be of good quality, showing an average width of 5½ feet and 275 feet in length. The winze extending from the third level down, a depth of 130 feet, shows continuous ore within 15 feet of the third level, and is of an average width of about 8½ feet. From the fourth to the fifth level the winze is 53 feet in depth; ore good, and now five feet wide in the winze. A drift is being run to connect with the winze on the fifth level, and where the ore is cut on that level the vein is twelve feet wide and looking well. Since the annual meeting they have been extracting from 55 to 60 tons of ore per day.

Imperial—dropped from $103 to $85, and closed at $87. The work in the lower levels has not yet produced any favorable results.... Kentuck sold at $262@256, and closed yesterday at $260. The bullion receipts for the current month to the 17th amounted to $30,910. ....Overman declined from $66 to $55 and at the close sold at $51. On March account the bullion returns aggregate $5,061 43....Ophir sold within a range of $35 50@30, and closed at $29 50. On the 17th instant the drift was 91 feet in length from the shaft. Rock continues hard....Confidence sold at $32 50. The bullion yield to date on March account aggregates $7,929....Sierra Nevada sold at $32 50@35, and closed at $36. Receipts of bullion to date for March account, $7,339.

Amador—experienced a decline, a few shares selling at $260@265, and yesterday afternoon realized $272 50. We understand that the first clean-up for the present month will aggregate between $30,000 and $31,000 in bullion.... Belcher closed at $17 50. An assessment of $3 per share was levied on the 15th instant.... Golden Chariot (Idaho) sold at $50. The bullion yield for the month of February aggregates $43,027 24; in January it amounted to $45,630 88. A dividend of $2 50 per share is payable to-day.

Earthquake-proof Chimneys.—We noticed at No. 749 Market street three very large galvanized iron chimneys, the outside being an octagon shaft, with ornamental cap and base, fourteen feet in hight, with an average width of four feet. Within the shaft are four heavy iron flues to convey the smoke—the whole being firmly riveted and making a very substantial chimney. No external bracing is required, as the apparatus is held in place by angle irons attached inside the flues, extending down and fastened to the brick work of the chimney below the roof. It is thought by Messrs. Conlin & Roberts, by whom they are built, to answer all the requirements of an earthquake region. They are intended for Mr. Thos. H. Selby's gothic residence at Fair Oaks.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

The Redemption of Tide Lands on the San Joaquin, at and around Sherman Island, is estimated by a correspondent of the Sacramento *Union*, at a probable cost of from three to five dollars per acre. When reclaimed they would be worth from twenty to thirty dollars per acre, with a prospective increase to forty or fifty. In very severe winters, like '61-'2, these lands would be flooded, but not subject to any currents. The dykes, dams, and ditches, used for reclamation, would remain uninjured, while the rich alluvial deposits of the flood would add additional richness to the soil. After reclamation the crops of grain and staple products would be certain every year. Rice evidently, ho says, could be cultivated on these islands. The soil is rich, and the means of reclamation would afford the same convenience and cheap process which have been long practiced in the Carolinas; that is to say, make the water do the work. Dams erected across the mouth of the sloughs would check the tide-water, and also form a reservoir from which the field of rice could be flooded at pleasure. No grain, on lands situated as these are, can be cultivated more cheaply than rice. It requires but a small quantity of seed for the crop, and, having the convenience of flooding the land, the principal cost is the gathering.

The Recoil.—The parties who thought to lessen the popularity of the Plantation Bitters by alleging that, under a different name, the same article effected the most astonishing cures in the West Indies thirty years ago, have afforded the world another proof that malice and envy often defeat their own objects, and give new prestige to that which they would fain discredit and destroy. The proprietors of the Plantation Bitters, Messrs. Drake & Co., while acknowledging the origin of the preparation, have had an opportunity of showing that, the rare elixir admitted, even by its interested enemies, to be so wonderfully potent before it changed hands, has had its remedial properties *almost doubled* by the addition of a new ingredient—Calisaya Bark—since it became the property of its present owners. If, therefore, it was so nearly infallible in cases of intermittent and remittent fever, dyspepsia, biliousness, etc., *then*, it must be *quite so now*.

Our Office.

The office of the Mining and Scientific Press is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

DEWEY & CO.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

AMADOR COUNTY.

Jackson *Ledger*, March 13th: The new shaft at the Coney mine is gradually going down, and looks well. The timbering is done in a substantial and workmanlike manner, and presents an appearance of durability seldom seen in any mine in this district.

CALAVERAS COUNTY.

Mokelumne Hill *Chronicle*, March 13th: The weather continues warm and delightful—too pleasant, in fact, to suit the miners, who are complaining of the scarcity of water in those localities which are not reached by the ditch. The gulches are almost as dry as they are during the summer months, and those who had calculated upon late rains in the spring, to afford them facilities for washing the dirt accumulated, are venting their spleen upon the clerk of the weather.

Champion, Peters & Ahnert, have determined to re-open the old Union shaft, on Stockton Hill, and are engaged in perfecting preliminary arrangements. The mine has been abandoned for years and is filled with water.

EL DORADO COUNTY.

Placerville *Democrat*, March 13th: We are informed that the Crystal Lead Co., whose claims are near Brownsville, are now down 100 feet, and at that depth have a ledge three feet wide. From a ten days' run recently, they had thirty pounds of amalgam, worth $70 per pound.

Ninety tons of rock, recently crushed from the Stillwagon and Norton claim, situated near Brownsville, in this county, yielded $1,140.

FRESNO COUNTY.

Mariposa *Gazette*, March 12th: Nathan Harbert has just completed his new mill of ten stamps, for crushing the ore from his rich mine in Fresno county. He only awaits some necessary machinery already ordered from San Francisco. The rock from his vein will pay $80 per ton, which is surpassingly rich.

Marysville *Appeal*, March 14th: Eleven tons of copper ore were shipped from Stockton to San Francieco on Thureday. It was from the Buchanan mine in Fresno county.

KERN COUNTY.

Havilah *Courier*, March 9th: Col. A. A. Rand, as trustee, gives notice according to law that he intends to apply to the United States for a patent for the land on which the Relief mine is located.

MARIPOSA COUNTY.

Gazette, March 12th: A correspondent furnishes the following concerning the new mill recently finished on the Merced River by the Mariposa Co: The new mill at this place is in full blast, having 16 stamps crushing about 15 tons of ore in 24 hours. The mill crush 13 tons of the hardest white quartz that comes from the Pine Tree mine so fine that four-fifths of it will pass through a sieve of 2,500 meshes to the equare inch. This fine sand ie carried by conveyers and elevators to the drums. These drums are four in number, and are made of boiler iron, and riveted together in the same manner as eteam boilers. Each drum is five feet in diameter and three feet long, lined inside with cast iron one inch iu thickness, and is charged with 2,000 pounds of cast iron balls, of about one ounce weight each; then 1,000 pounds of sand is thrown in, and the mase set in motion, making 25 revolutions per minute. This revolving, grinding motion is continued from 40 to 60 minutes; the sand is then discharged and conveyed to the amalgamatore, where it is eubjected to a boiling process with superheated steam for about 30 minntes; it is thon let out into a tank below and cold water from a hydraulic hose is let on which washes it down into a shaking table below. When the charge has heen washed through the tahlo tho tahle is cleaned up and the amalgam pauued out, which completes the process. The whole procoss takeu together is called tho Eureka, or Ryersou process. The rock pays to my certain knowledge about double what it will hy the wet process, aud yet there is not a corresponding difference in the cost of reductiou. Another important item of machinery lately put up in eonnection with the new mill is the Thunderbolt Crusher, recently received from New York. It is claimed by the inventors that tho Thunderbolt will reduce a large proportion of the rock to a fine sand; but that is a mistake—only about one tenth is reduced to a eand fine enough for the drums. It is an excellent epaller to prepare rock for the batteries, and iu some respects an improvement on the Blake spaller. The Co. have a large quantity of rock on hand, and the mine is iu a coudition to get from 75 to 100 tons a day. Another new mill of 25 stamps is being commenced, which, when finished, will double the capacity for reduciug quartz.

NEVADA COUNTY.

Transcript, March 9th: Hook, Crawford & Co. have located 600 feet of Green Horn creek, Little York township. The location commences at the first falls and extends down the creek.

March 11th: The West Eureka Mining Co. filed their certificate of incorporatiou in the County Clerk's office yesterday. The Co. is organized for the purpose of mining the Turnpike Milk Ranch Quartz Ledge.

March 12th: The Buckeye Co., owning the North Star ground, have sold their mine to H. Mackie, Henry Philip, Butterworth, Pioche and Robinson. The interests of Stoakes, Watt and McCowen were transferred by this sale. This Co. has heen prospecting for some time for the gravel channel and have recently found excellent pay dirt. The new owners are fully able to prospect the ground thoroughly.

March 13th: M. C. Taylor has located the waters of Wolf Creek for mining and milling purposes, commencing at a point 100 feet above the erossing on Anhuru street, Grass Valley, and conveying the waters to such points as may be desired for mining purposes.

Henry Thomas & Co. have located 1,000 feet on the second extension of the Roanaise mine, Eureka ledge. The location is bounded on the southeast hy Dorsey & Co's claim, and extends thence northwesterly 1,000 feet.

Sinco the last storm ditches which carry water to the Scott's Flat miuers, have been closed by snow, but uow they are running water, and the miners will soou commence washing.

The Eagle claim, at Moore's Flat, is being worked. The Co. have been engaged in raising their shaft to the surface, and will soon be ready to eommeuce washing.

Grass Valley *National*, March 9th: Wo paid a brief visit to the Eureka mine this morning. and fouud them eugaged in melting. The proceeds from a run of two weeks were three bricks, the aggregate value of which was over $23,000.

Grass Valley *Union*, March 10th: The Empire Co., on Ophir Hill, is now taking out very rich rock from the bottom of the shaft. Free gold in abundance can he seen iu the rock, while the eulphurets are unusually heavy aud rich. This morniug they sent of $23,000 worth of gold bars, the proceeds of two weeks run of the mill.

Yesterday the Allison Ranch mine was sold at Referees' sale, and tho property was knocked off to Alfred E. Davis, for the sum of $60,000 in currency.

The West Eureka Mining Co's claims are situated on Worthington's ranch, just about a mile northeast of Grass Valley. Their ledge is supposed to be the same one on which the old Eureka and the Idaho mines are located. The owners are sanguine of having a good thing, as gold in great quantities hae been seen in the ledge.

March 11th: The Harterey mine, on Wolfe creek, not far above the Allison Ranch, is again at work, the Co. reöpening it having obtained a lease ou favorable terms from the owners.

The Wisconsin Co. started up their pumps day before yesterday, and as soon as the water is all out of the mine men will go down into it to take out rock.

The Grass Valley mino did yesterday, or will to-day, start up its pumping apparatus to free the shafts of water.

The Mobile ledge situated just north of the Eureka Co's works is heing opened up in shape by the Eureka Co.

The New York Hill mine must be worked the coming summer, since tho yield of the mine iu times past has been very great; and where tho mines left off in the levels the rock was looking better than any which ever came out of the mine.

On Massachusetts Hill, famous in times past, the mills are idle and the rust is fast eatiug up the machiuery.

Ou Osborne Hill, and on Sebastapol Hill, several companies are working away, and are paying their way as they go. Miuers on both these hills have the true theory and are working up to it.

Altogether the mining prospects of Grass Valley were never better thau they are today. The summer, it is calculated, will be very favorable to miniug, since the winter has been a comparatively dry one.

Transcript, March 16th: The owuers of the San José Gravel claims have found in their prospect tuuuel gravel which yields seven grains of gold to three paue of dirt, and they have now commeuced sinkiug a working shaft, in which they expect to reach the channel 125 feet below the surface.

Thirlwell & Co., adjoining the Young America claims, have for some time past been prospecting the ground with a tunnel, which is in some 700 feet. At the end of the tunnel gravel was struck that paid as high as $1.30 to the pan, but ou account of bad air, and the hed-rock pitching downward, it was found necessary to sink a shaft in order to prospect the ground more thoroughly. The compauy are now sinking a double shaft, which is down ahout 50 feet, and which they intend to sink 80 feet deeper, when it will be 50 feet below the tunnel.

Grass Valley *Union*, March 18th: The pay streak in Underwood & Co's hydraulic diggings has been lately struck in a very rich spot, and as high as $10 a day to the hand has been taken out, since the new cut was run into the hill. The hed-rock pitches into the hill, giving evidence of an extensive and rich gravel deposit. We saw a uumher of heautiful epecimens of washed quartz gravel covered with gold.

PLACER COUNTY.

Truckee *Tribune*, March 12th: From Dutch Flat we learu that the Baker Bros.' mill cleaned up a few days since, after eight days run with eight stamps, $1,350. The ccment averaged about $2.75 per car. The claim is imperfectly opeued and much difficulty is experienced iu getting out gravel. The King Bros. have struck an immensely rich streak of gravol in their claim. As high as $300 having been obtained from a single pan of dirt. Very rich specimens of cement are ou exhihitiou iu town. A great excitement prevails amoug the people and activity once again seems to pervade the town.

PLUMAS COUNTY.

Quincy *National*, March 6th: A correspondent writing from Crescent Mills says: The Enterprise Mill, in Light's Cañon, Indian Valley, is in operation and is running on good paying silver rock. Mr. Wilmot, the Superintendent, has made two "clean-ups," and says the rock will pay well. The quartz mills in the Cherokee district are running regularly and paying finely. Chapman & Bros., of Coppertown, havo made a short but paying run with their smelter.

SHASTA COUNTY.

Courier, March 13th: Mr. Freeman, a member of the Shasta Hydraulio Co., at Piety Hill, has selected specimens of ore from several of the South Fork ledges, with a view of thoroughly testing their worth by means of careful assays. About half a ton of these specimens have been shipped to San Francisco, whero Mr. Freeman has made arrangements to have them worked and assayed by the best experts in the city.

SIERRA COUNTY.

Downieville *Messenger*, March, 13th: J. Alexander took from his diggings, behind Armory Hall Livery Stable, on Saturday last, a piece of gold weighing five and one-half ounces, besides two ounces in fiue dust.

SISKIYOU COUNTY.

Yreka *Union*, March 6th: Owing to the scarcity of water, but few Chinamen are now at work in this county.

Lash & Co. have just cleaned up a small crushing—about 30 tons—from the Accidental. The yield was $19 to the ton.

But little is being done in mining on Scott River at the present time, on account of the scarcity of water.

We understand a Portuguese compauy ou the Lower Flats have struck it very rich in their claim and are takiug out the ore by the pailfull.

A friend writes from Cottonwood that times are very dull there at present, and miniug almost suspended. The Blue Lead Co. struck gravel on Wednesday and the prospects look favorable.

TRINITY COUNTY.

Weaverville *Journal*, March 13th; Phillips & Daniell have recently made a discovery of very rich quartz on Deadwood, a small creek emptyiug into Trinity river, about ono mile above Lewiston. They are said to have found rock ahounding in free gold, visible to the naked eye. Deadwood is noted for quartz gold, and it has long been the current opiniou of residents in that vicinity that valuable gold-bearing quartz existed in the adjacent hills. We are satisfied, from our own observations, that there are good paying ledges on the head of the creek.

H. A. Jones is opening a claim iu the banks of Trinity river, a short distance below McGillivray's. Mr. Jones has already found gravel that prospects 50 cents to the pan. His claim is in a locality that has always been reputed to contain rich deposits of gold, but could not he tested for want of water. McGillivray's ditch has supplied this doficiency, and the diggiugs at Park's Bar and the claim first mentioned have already been discovered, promising to pay well.

YUBA COUNTY.

Marysville *Appeal*, March 13th: We hear that 150 shares in the Pennsylvania, owued by Hannsman, were sold at San Francisco, a day or two ago. The price was not ascertained, though $16 has been asked for the same.

ARIZONA.

Prescott *Miner*, Feb. 27th: Seven or eight miners have arrived here from Black Cañon diggings, Bradshaw mining district, and all expressed themselves well pleased with the diggings. There are about forty men on the creek. Poland, Marsh, and others, have a hench claim, in which the dirt prospects well. As high as $1.50 to the pan has been got by them. We eaw a lot of the gold brought up by the minere and it looked as though it were worth $17 the ounce. We predict that the Bradshaw miuing district will never again be abandoued. There are plenty of claims there that will pay from $4 to $10 a day to tho hand. Indeed, Poland & Co., expect to make $20 a day to the hand, as soon as their ditch is completed.

Dr. Alsap gave us a small piece of quartz, found by one of the party, near Big Bug, which contains a great deal of gold. Mr. Williamson found a pieco of quartz from which he took one piece of gold weighing twenty-fivo cents.

Owing to the cold weather, Jackson, Lovejoy & Co., on Lower Lynx Creek, have been unable to work their hydraulic claims to advantage. We learn that the last run made yielded $9.33 to the hand. Now that the weather has moderated, they expect to make as high as $12 and $15 per day. They have sent to California for another hydraulic apparatus, and, as soon as it arrives, will start work on another claim, above that in which they are now working.

Young, Scott & Sloue are working a bar on the Hassayampa, below the mouth of big Copper Creek, and are making fair wages. Other parties are working above them on the creek.

Reports to the effect that rich placer diggings have beeu found near Camp McDowell, 100 miles east from Prescott, have reached this place, but wo know nothiug definite in rogard to the diggings. It would not surprise us, however, if rich diggings had heen found iu that vicinity.

Outside of Wickenburg, little is being done in the way of quartz mining. At that place, at last accounts, both mills were running with good euccese, and the mine was as good as ever.

At Walnut Grove, some men have built an arastra and will commence working ore from the Mammoth lode as soon as it can be hauled.

The ledge in the Stirling mine is noarly twelve feet thick, and the quartz is as good as ever.

Some of the ore from the Chase mino taken to San Francisco, and worked there, paid as high as $600 per ton.

Nothing can be done at Walker's Creek until the snow—which is four or five feet in depth—melts.

With the opening of Spring, we have reason for believing that our miners will have new life and energy instilled into them, and that several companies now idle will go to work in earnest.

COLORADO.

Georgetown *Miner*, Feh. 17th: The editor says that many persons suppose that the ores of White Pine, by assay, overshadows all other ores in the world, and goes on to name a numher of mines about Georgetown that have yielded as rich assays in silver as any yet discovered in White Pine, amongst which are the Bethany, $22,000 per ton, and the Amador mine $19,000 per ton. He says: Besides those two veins we have seen recent assays from the Anglo Saxon, situated on Saxou mountain, of over $8,000 in silver to the ton. If we had the time aud epace necessary we could give huudreds of assays over $1,000 in silver to the ton.

The Terrihle still continues to increase its production as the workings are extended to greater depths. The main shaft is now 170 feet in depth, carrying five inches of solid mineral. From the main shaft, 50 ft. from the surface, two levels have been run, the east oue 140 feet in length. A winze ie being sunk from the floor of this level, 160 feet from the main shaft, to connect with the 125-foot level. There is eight iuches of solid mineral in this winze. The east 125-foot level is now in 40 feet, and is being driven as rapidly as possible. The west 50-foot level is now 150 feet in length. The stope in this level, 50 feet from the main shaft, is carrying five inches of mineral. The ore from thie mine is galena and zinc-blendo, the former predomiuating, carrying

brittle and ruby silver, argentiferous gray copper and native silver, and yields in bulk, $500 to the ton. Nine and a half tons, shipped to Balbach's works, Newark, New Jersey, some three or four months since, gave a gross return of $5,772.12 in currency. Twenty tons are now on the route to the same works, and ten more will be shipped as soon as the sacks can be obtained. Lying on their dumps there is some 200 tons of second class ore, which they intend to crush and dress.

The Felton mill in Granite district is running regularly on ore from the Magenta mine with very good results. Harrison's mill is running on custom rock from various lodes. Their last clean up from Hattie Jane ore indicated a yield of nearly $1,000 per cord. The veins, which are nearly all quite narrow at the surface, have generally increased in width as they have been sunk on, without any perceptible diminution in the richness of the ore. The ore has thus far been almost exclusively decomposed quartz rock, with no sulphurets, but of late some of them are yielding coesiderable iron.

Denver *News*, Feb. 10th: There has been some talk recently of an attempt to start works in Denver for working gold, silver, copper and lead ores by smelting.

IDAHO.

Owyhee *Avalanche*, March 6th: The south extension of the Silver Cord, lately incorperated in San Francisco, is going to be worked soon.

The shipments of bullion from Wells, Fargo & Co's office in this place, during the month of February, amount to $91,-645.76, coin rates.

The Ida Elmore mill will steam up again about the 20th of the present month. The mine has been put in excellent condition for working, and the yield for several months to come will be enormous. Teams are now engaged in hauling ore from the mine to the mill.

Boise *Statesman*, March 6th: William Nevill, returned from a trip to Centerville, says the town is extremely dull, but if the pleasant weather continues, the water will begin to run in a week or two longer. A few miners are already making preparations for work.

W. A. Goulder writes from Shoshone County, to a friend in this city, dated Pierce City, February 15th, 1869. He says: Snow is about two feet deep here now. The weather is very fine. A party came in from Mooso Creek the other day on snow shoes, having been seven days on the road. They report all well, and prospecting. Many good claims have been found during the winter, and considerable money has been taken out with rockers and pans. There is no longer any doubt that they are good mines, both rich and extensive.

The recent news from the Alturas mines is of the most encouraging nature. The great Atlanta ledge, if located in White Pine, would have thousands of men rummaging every cranny in it before a week, but as it lies in quiet Alturas, and has been a common-place topic so long, people now are loth to believe that it assays from $500 to $20,000 to the ton. M. O. Moody called in yesterday and gave us some information from there, at the same time exhibiting some specimens of ore from the Atlanta, one of which assays $26,540 per ton. That class of ore lies in a body or streak about six inches in thickness on the west side of the mine and next to the easing. About one-half of the body of that vein is composed of the same grade of ore, nearly solid silver. Next to the east easing is another vein about two feet in width, a trial of which yielded one-half its weight in metal. No assay of it had been made when Mr. Moody left. These are struck in the tunnel, which is now 150 feet long, and reaches a point 105 feet perpendicular from the surface. The mine is over 20 feet wide, and the rock lying between the two veins described above, yields over $400 per ton. Mr. Armstrong, foreman in the mine, says there is three years work in sight. The Monarch Co. have now on hand some 1,500 to 2,000 pounds of bullion awaiting passable roads to get out.

Walla Walla *Statesman*, Feb. 19th: A gentleman just down from Kootenai reports the new mines on Perry Creek as prospecting finely. Large numbers of miners who had wintered in the Hell Gate Valley, were coming in and taking up claims. They report very little snow on the mountains and the traveling excellent. The new mines will furnish employment for several thousand men, and now is the time to secure claims..... From a private letter dated Humboldt Basin, Feb. 9th, we glean the following information in relation to their spring prospects for mining: "We are having a far better prospect for a mining season than the last two years, the snow being about 30 inches deep on a level. Altogether, the boys are in better spirits than usual. If any of your friends think of coming up this way in the spring, I would recommend them to the following camps, where there is good diggings, and where they employ a large number of hands during the mining season and pay good wages: Humboldt Basin, Rye Valley, and Amelia, or New Diggings, all of which are good camps. Considerable prospecting has been done within a circuit of from 20 to 30 miles, and in several districts good prospects have been found. I have no doubt but that several new camps will be worked the coming season with good success."

MONTANA.

Helena *Post*, Feb. 27th: The Lindsley Mining Co. have struck pay dirt in their shaft, and are actually taking the gold out.

The Diamond City mill of Hervey & Addis, which has been for the last 10 days pounding away upon rock from the Whitlach & Parkinson lode, cleaned up on last Sunday night. The result was a bar of gold weighing 293 ozs., and valued at $7,000. This is the product of 200 tons of unselected rock, crushed in 10 days by 10 stamps.

Affairs in McClellan Gulch are in a prosperous condition. A drain ditch is being run from McClellan to Poor Man's Gulch, the entorprise being undertaken and conducted by the owners of the claims in Poor Man's. By means of this ditch the entire length of the gulch will be worked the coming summer. In McClellan a great number of the mines have been worked all winter. The water that supplies that gulch in a great measure flows from springs and bears a temperature of such a degree of warmth that it flows in the sluice boxes even in the coldest weather. On the coldest days of this winter earth was being sluiced. Price & Co. are busily engaged in drifting, in the lower part of the gulch. In the upper part, where the pay dirt is not deep, ground-sluicing is resorted to. It is anticipated that the coming summer will see a large amount of gold taken out in the gulch. The ground which is now being worked has all been worked before, and in this re-working, from good wages to $9 a day per hand, is realized.

We were shown recently a lump of beautiful retort, which was the result of a four days' run in the mill being operated by the Plymouth Mining Co. In this mine four shafts are in process of sinking, the most extensive one having reached a depth of over 50 ft. From the rock taken from this shaft a run has been made which resulted in the aforesaid lump of retort valued at $400. This run was simply an experimental one, more for the purpose of regulating and coating the plates.

NEVADA.

ESMERALDA.

The Aurora correspondence of the Sacramento *Union*, dated March 8th, writes: A friend who came in from the Pine Grove mining district to-day, informs me that the mines there are looking very favorable. The mills are running successfully and the mines are improving in richness. The people are much pleased, and their prospects of success are very promising. Two or three new ledges have recently been located; in one of them about five and a half tons of rock have been worked, from which six and three-quarter pounds of retorted amalgam was obtained, and estimated at about $150 per ton of rock. The rock in the district is generally gold-bearing, but a recent location is of silver. The croppings are said to be over 50 feet wide, and the rock shows rich in wire silver. Crocker, the locator, was offered $1,000 for 200 feet of the ledge.

Parties came in to-day from Palmetto and Silver Peak, and report that there is much work being done in the mines, and that the prospects in both districts are very favorable.

REESE RIVER.

Austin *Reveille*, March 8th: Mr. Clark, of the Fisherman Co., in the district of Reveille, recently showed us a lot of samples of ore, weighing about 40 pounds, which were to be forwarded to San Francisco. The ore was obtained from three claims, belonging to the company, known as the Victorine, Santa Fe, and Fisherman, and much of it, especially the larger pieces of horn silver, is identical with that produced by the richest deposits of White Pine.

March 9th: We were informed by a person who returned from Belmont last evening, that it was becoming harder every day to keep men at work in the mines and mill in that neighborhood, even under the prospect of steady employment and liberal wages. The workmen are bursting their shirts in their haste to go to White Pine.

March 10th: To-day the First National Bank of this city shipped the last of nine bars of bullion, weighing 675 pounds, produced by Col. Buell's mill at Belmont from Highbridge and Transylvania ores. The destination of the bullion is San Francisco.

Belmont *Champion*, March 6th: As rich ore as was ever found in any country, has been taken from Reveille district, and reduced at Austin and this place. The principal portion of the veins or deposits of the district are, as in White Pine, surrounded by a limestone formation, and the general opinion that mines of this character were not permanent, has seriously retarded the development of Reveille district. A new discovery has recently been made here which bids fair to have the effect of bringing the district into favorable notice. During the present week Captain Baker brought into Belmont a ton and a half of ore, from this recent discovery, for reduction, which yielded $247 to the ton, and Captain Baker has every confidence that the ledge will yield many thousands of tons of the same kind of ore. This lot of ore was taken from the ledge indiscriminately, and was not assorted at all.

John M. Reed on Wednesday last, favored us with an examination of a sack of specimens of ore, weighing 30 or 40 pounds, from the Seneca Co's location on the U. S. lodge, in what is known in this section of country as the Stone Cabin range of mountains. Mr. Reed has had some eight or ten assays made of the ore, the lowest of which gave a result of $161 per ton, and the highest showed a value of $1,367 per ton. One pound of ore from different portions of the ledge, pulverized and thoroughly mixed, gave an assay of $987 per ton.

In both the north and south shafts of the El Dorado South mine, work is being prosecuted vigorously, and daily large quantities of high grade ore are being raised to the surface. These portions of the mine never looked better than at the present time.

The Belmont Co's mill is running steadily day and night upon ore from their Transylvania mine, and is doing good work, as the number of bricks shipped fully attest.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Virginia *Enterprise*, March 9th: The Belcher Co. now have some 400 tons of good milling ore on their dump. They have good bodies of ore both at the 200 and 335-foot levels.

March 10th: The Julia Co. are vigorously engaged in prospecting their mine, situated to the eastward of the Cornish.

A very large body of fine sulphuret ore has lately been found in the 900-foot level of the Yellow Jacket mine. The mine is at present looking well in every part.

Operations will shortly be resumed in the Sacramento mine, situated on Cedar Hill. The ores extracted will be crushed at the Summit mill, as formerly.

March 11th: The Sierra Nevada Co. yesterday found a deposit of quartz much richer than anything they have yet found. From some of the specimens taken out, wires of gold half an inch in length projected.

The Ophir drift west is now in about 70 feet. They expect to strike their front ledge in going 130 feet farther. The rock through which they are drifting is very hard.

March 13th: The Imperial is now yielding about 120 tons of ore daily from the upper portions of the mine, sufficient to keep both of the mills of the company running.

The Savage mine yields between 1,000 and 1,400 tons of ore per week, averaging about $35 per ton, and employing about 170 men daily.

WHITE PINE.

Treasure City *News*, March 6th: An illustration of the great richness of this district was given during the past week. Masten & Arrington, at Menken, engaged two men to sink a well in Mazeppa Cañon. After sinking to the depth of about 15 feet, a ledge bearing a rich body of ore was encountered and located as a mine by the well-diggers. Of course no more progress for the purpose proposed could be made, and a new locality was sought. Here again, after sinking a few feet, another rich vein was struck, claim made and well abandoned. This was too rich a place to devote to furnishing water only, and in a more distant locality it was concluded to dig the well. Sinking has been resumed, but with what result we are not advised.

A prospecting party under the leadership of James Basey, left this city a few days since on an extended tour of exploration in the direction of the Steptoe Mountains, and possibly to extend into the Wasatch range, south of Salt Lake.

Quite a stir was created in the neighborhood of the Eberhardt mine, a few days since, by the discovery of native gold and silver in the La Monte mine, which is located about 250 feet north of the Eberhardt, and runs parallel with that great vein. The ore extracted contained beautiful specimens, showing both gold and silver in considerable quantities, besides the usual ores of the latter metal.

The developments on the Willimantic, situated at the foot of Chloride Flat, have been very favorable during the past week, and some of the best ore of the district obtained. Assays of ordinary ore show a value of $461.93 per ton, and some of the choicest specimens reach $2,500 per ton. The ledge is now showing a width of four and a half feet, and all appears to be mineral of a good quality.

On Tuesday last, some miners working in one of the old locations on the Base Metal range, came upon a mass of ore rivaling in purity and value the best of Treasure Hill. The ore found was brought to town, and upon assay proved to be worth from $2,000 to $3,000 per ton. The story of its discovery soon became noised abroad, creating a great excitement, and on Wednesday a rush of prospectors, speculators, surveyors and town locators commenced for that locality. The point is about one and a half miles northwest of Treasure City, although by the road leading there it is about three miles. The locality is known under the various names of Northern Light Mill, Chlorido Flat No. 3, and Base Range; but a town has been laid out and named Babylon.

The bullion receipts of the assay office of T. M. Luther, Silver Springs, from Feb. 7th to the 28th, amounted to $105,857.33; and for the week ending March 2d, 37,731 ounces of crude bullion.

Several new and rich claims have been located in the immediate vicinity of Hamilton. The ore is said to assay rich.

Austin *Reveille*, March 9th: The Silver Springs correspondent writes: Great excitement prevails in prospecting circles, most particularly on the west side of the road leading from this place to Hamilton, where some very rich strikes have been made, some two or three days ago. This new discovery is in the Base Metal Range.

Luther & Huey are still pushing the work on their tunnel. They are now working four sets of hands, and the tunnel is over 300 feet in length.

The Moore & Barker mill has started, and is running with good success. The Oasis mill was shut down a few days for repairs, but started up day before yesterday.

March 10th: Eight bars of bullion, weighing 815 pounds, and valued at $14,-839.29, were shipped by the agency of the Nevada Bank at Treasure City, White Pine, overland to New York city, on Thursday, the 4th inst.

OREGON.

The Jacksonville *Sentinel* of March 6th says that mining in that section during the past winter has been a complete failure on account of the scarcity of water, and urges, not only the miners, but the farmers, to unite and contribute a small sum each to be expended in bringing the waters of Applegato Creek to the Sterling mines. The editor says that the enterprise can be completed at a cost of less than $60,000, and that the ground thus provided with a sufficiency of water cannot be worked out in the next 40 years.

SOUTH AMERICA.

A company has been formed with a capital of half a million of dollars, to work the mines of Oreamuno and their continuations, called the San Rafael and La Minta, in Chili. Those mines were discovered and worked in 1825, yielding, it is said, large profits, but unfortunately were flooded with water. The Directors assert that during the short time they were in operation they yielded one million and a half of dollars, which forms the foundation of the capital of the Republic. The corporation is called "Compañia del Monte del Aguaeato," and located in San José.

WASHINGTON.

Olympia *Transcript*, Feb. 20th: For some time past, a number of men have been prospecting in the region of the Black Hills for gold. We have heard rumors of their finding the "color," which could hardly be otherwise, considering that it can be found in small particles in almost every ravine in the county. We learn, however, that some of the citizens of Miami Prairie and that vicinity have opened a road to Waddle's creek, and would take a wagon load of sluice boxes in on Wednesday last, to test some ground on the creek.

We need scarcely tell our readers that it is the best mining and scientific paper published on the continent. *Ed Mercury.*

OAKLAND.—W. B. Hardy.
A. S. Hopkins, No. 70 J street, Sacramento.
WHITE PINE DISTRICT.—Alexander Bruckman, Hamilton, Nevada.
HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, March 20, 1869.

Notices to Correspondents.

ALKALI, Sacramento.—The mode of obtaining soda, which has been employed so successfully from the date of its invention, by decomposing in the first instance common salt by means of mundic acid, was invented by LeBlanc, in reponse to the offer of the First Napoleon of a reward of 1,000,000 francs for a more cheap and extensive method of obtaining soda—a promise, however, which Napoleon never fulfilled. There are few instances of an industrial improvement holding its own for half a century against so many competitive efforts to outvie it. The patented inventions in England on this subject since 1830, amount to more than 300, and "the cry is still they come."

A LOVER OF ORNAMENT.—The flexible cups you are inquiring about have no doubt reference to some specimens of Burmese varnished ware—a variety of art in which that nation excels beyond all others. This ware, in its hot state, is like very fine papier mache; it is thin and light, and so flexible that the two sides of a cup may be preseed together so as to touch each other, without cracking the coloring or at all injuring the article, which returns to its former shape as soon as the pressure ie removed. The colors usually employed are black and vermillion, hut more commonly yellow or green, upon a red ground, or red upon a black ground; and very superior articles are decorated with raised figures of gold.

SAUCE, San Diego.—Of the olive tree, Mr. Lang (a Scotchman) observes in his travels through Italy: "Truly, their (the Italians) plenty is their curse. Suppose every kail-yard in Scotland had a tree growing at the dyke-side, like the old pollard saughs we usually see there, and requiring as little care, or cultivation, and from this tree the family gathered its butter, suet, tallow, or an oil that answered all the household uses of these substances, whether as a nutritious adjunct to the cooking of the daily meals, or for soap, or for affording light,—all, in short, that our grass-lands and dairies, our Russian trade, our Greenland fisheries, produce to us for household uses. Would it be no blessing to have such trees?" We do not think we could better advocate the cultivation of this valuable tree and emblem of peace, as desired by our correspondent, than hy inserting the above quotation.

H. C. K., Dutch Flat.—We will endeavor to throw some light on the subject of your inquiry next week.

SLATE QUARRIES.—We are informed by Mr. M. Honigsberger that a first-class article of slate can be quarried in the vicinity of Copperopolis, to which point the Stockton and Copperopolis Railroad will be extended in the course of the summer, unless the railroad company should choose to forfeit their charter.

"Going to White Pine."

It is a common expression,—for White Pine is El Dorado now. Everybody is going to El Dorado; hut people take very different roads to the same, and the soher country finally attained is never exactly the same as the country sought for, aud pictured hy the imagination.

The road to White Piue, as described by correspondents, must be indeed an instructive sight—a comment upou poor humanity and the laws governing wealth and society. Mankind are slaves, willingly and enthusiastically so, to an arbitrary conventionality or law, the Rule of Coin, which is more inexorable aud more tyrannical than monarch ever dreamed of beiug; exalting the rich and relentlessly crushing the poor or unfortunate into the most helpless degradation and even suffering. White Pine is a Mecca, at this moment, hecause nature, in her odd, apparently freakish way to our present scientific discernment, has concentrated tens and hundreds of millions of dollars' worth of silver there. We would like to photograph this stream of travelers to White Pine—from Salt Lake, from Chicago, from Idaho, and from Oregon, aud the great main artery from California, as briefly noted in their proper department in this number of the PRESS. The stream has been flowing for weeks and months, and neither frost, nor bitter winds, nor want of covering at night, nor dilapidatiou and scarcity of shoe-leather, nor hunger and want of the means of providing against the same, have been ablo to congeal it into rigidity for a single moment. It is a pitiable, and yet a merry pilgrimage,—at the risk of life, conscieuce and soul with not a few. Mankind are reduced in it to naked first principles; and how wonderful are the resources of energy developed in such an aggregated mass! It is sublimo to think of the unlimited possibilities of combined human energies, excited by an adequate cause.

And worthy indeed, should be the cause, or motive, that has set all this in motion. The rude shuffling race for wealth has been decried, and the abandoned devotees of unscrupulous money-power have called forth nothing but contempt from all the uobler minds of the world; yet power the rich undoubtedly possess, no matter how they may have attained it; the truth heing that we are all subjects to the same Law, aud we must either suhmit to and adapt ourselves to its conditions, or be abject slaves, not even feeling that we are men.

But the rush to White Pine as we see it is really not created in any sense by unworthy motives, but, on the contrary, in nearly every case there are individual reasons the most meritorious in the world, could we but read the hearts and the history of those who are passing. Accidentally we may know the secret springs of actiou—not in the "dead broke" cases alone, of chronic or temporary affliction. We can distinguish, perhaps, amongst the rude and roughly-accoutered crowd, a fair and emooth-faced young man of intelligent appearance who showa a genial and hopeful eye, but deeper in his heart, if you should learn to know him, would evidence a resolute and profound purpose as nnquenchahle as the force of life itself, for he has left a worthy mother who not only hopes for, hut is dependent upon him, and whose anguish of solicitude the world probahly never even suspects. We see another, a sturdy honest fellow who can drivo oxen, getting along in the strife as best *he* can; we saw his sister—unfortunate slave, too!—in the company of some fancy men and women at Elko the other day (vide telegraphic dispatch.) We take our bearings of these disgusting but exquisitely booted and jeweled and ringed "gentlemen," who carry navy six-shooters, and a little derringer beeides, and who use both unhesitatingly, but are arrant cowards nevertheless. The "capitalist" passes us, in the most extensive of overcoats—but he is, more probably than not, only an agent of capitalists, and he may he on the scout, with possible victims in his mind's eye. A served-out convict who comes along, enters into the front of the excitement, and feels that life here places him on a tolerable equality, and gives him a "fair show" again. A scientific man plods aloug, who unassumingly interests himself in the geology of the famous mountain, and its chlorides; but no comparisons, or generalizations of his, from the closest observation and study of the ground, can place his opiniou on an equality, at White Pine, with the man who has "struck it," especially if the latter has an indefinite way of using a few technical terms. But undeniably the general tone of those we meet on the road or at the mines is generous and manly; public sentiment, wherever it mauifests itself, is rough and aboriginal, but it is sound; aud the sympathies that rule stand out uobly in contrast with the extremest acts of selfishness of which men are capable—as if the observers felt apologetic for such human weakuess, and meant to counterbalance matters for their own satisfaction.

It is well that men have motives for exertion. White Pine will not be a failure—for the country will at least he developed. It is woll indeed that the nine-tenths who fail in their hopes may yet be all successful; while the few who get tons of silver may prove tho greatest failnres of all, for we know that silver is only a conventional measure of things held valuable in the world for the happiness they may confer, which result depends upon the use made of it, but not more than upon that made of our daily surroundings without it, the basis being in the individual's character and absolutely independent of wealth.

Let every man, theu, travel to his *own* White Pine; and let him press forward resolutely, laboriously, perseveringly, and with manly epirit; for our wealth, silver or no silver, is in the telling deeds we can accomplish, our share of happiness in the use we make of the beautiful and the good things that creation offers to us out-doors and in, at every turn, and from which we have only to select. The incentives that move us through life shall thus carry us to a worthy goal; the successful being those who, having worthy motives, accomplish the same—the more worthy the greater the success.

We would not hinder the rush to White Pine. Let every body go that feels impelled, or justified hy the promise. There is something captivating to the imagination in going to a Potosi for wealth. No harm can come of it, for the railroad is open, and it will be easy to rush back again, and be the more content in developing positive and certain resources. As a matter of course White Pine will have to he overdone, and "when the smoke clears off" there will he many a flat, and many a ledge like the late new discoveries in the Base Metal Range, deserted to the few who intend to deal hard knocks in miuing; the dupes, with the dupers in the crowd, and the "leading capitalists" who lend their names to a good thing or a swindle for a three-fourths interest, having all gone farther on, but still pressing forward frantically on the straight road to El Dorado; whether it bo called White Pine, or any other name that sounds as well.

TESTING AND ASSAYING OF ORES.—Mr. J. S. Phillips has fitted up a room at No. 423 Washington street, near the Postoffice, for the purpose of giving instruction in the testing and assaying of minerals, with the blowpipe and also in the wet way. He has every facility, and is a competent instructor; heing the best blowpipist that we know of in this city. A few hours of instruction might be made of great value to silver pilgrims. His advertisement will be fonnd in another column.

Electricity and Amalgamation.

There are now two processes of amalgamating with the aid of electricity before the public, both of which are put forward with very fair pretensions to economy; and we are rather pleased to note that the proprietors, or inventors, have fallen into a contest with each other as to their respective merit and originality. The hattle is very mild, it is true, aud not much to the issue. But it will do more good than harm to all concerned; for these new processes should rather be torn to pieces than to be allowed to die of inattention and neglect. The Nolf and the Paul process appear to be entirely different in every respect. It does not seem to us to be proven that electricity has much to do with the success of either of them; as in the Nolf process no comparative working test has been made on the same ore and chemicals *with* electricity, and *without*,—that we have heard of,—to show how much is due to the electricity and how much to the sulphate of copper and salt; though it is evident that electricity has a tendency to prevent the latter from cutting up the quicksilver, which is a matter of great importance; while in the Paul process no current of galvanic electricity is applied at all, and no test has been made, so far as we are aware, to show that friction electricity has anything more to do with it than in ordinary barrel amalgamation. The Paul process is yet in the dark, as no one knows what chemicals Mr. Paul uses. Concerning the originality of the Nolf process, we understand that a caveat was filed for a patent about a year ago, but that no patent has yet been obtained, owing probably to the continuance in making improvements. Both Nolf and Paul deserve every encouragement in their efforts. We must state that we deem it both wise and commendable in Paul to have given at once his results on particular ores, for in that manner the public will be enahled to form some judgment as to the merits of his invention. In the working of the Nolf process we understand that the difficulty of separating the mercury and amalagam satisfactorily from the ore treated, has prevented them from giving any fair statement of the results of their process,—a difficulty which they hope soon to overcome.

Mention has been made to us of the reduction of rebellious ores lately, at Pioche's works, in three hours, at a cost of $5 per ton; and Mr. Paul thinks he can do the same by his process at $3 per ton. If there is sufficient truth in these assertions to make them *stay* true—new processes being notoriously liable to give us the slip on such questions after a little while—we can assure our readers that the additional evidences from working tests to convince everybody, will not be long withheld.

A NEW MANUFACTURING ENTERPRISE.—The prosperity of a country depends less on the abundance of its raw material, than npou the amount of its manufactured products. The prospectus of the California Tar and Turpentine Manufacturing Company, has been placed in our hands hy Mr. Alex. C. McKean, of 424 Montgomery street. The principal object of this company is the manufacture, under a new and improved method of tar, turpentine and resin, together with their concomitant eubstauces, pitch, charcoal, potash and wood acids, etc. for which the dense pine forests of our northern coasts are so well adapted. All needed information in regard to the operations of the compauy can be obtained from the above named gentleman.

VIEW OF TREASURE HILL.—H. H. Bancroft & Co. have published a fine lithographic view of Treasnre Hill, inclnding Hamilton and Treasnre City, from a sketch taken by E. W. Peet, which gives a better idea of White Pine as one would find it on going there, than would be obtained in any other manner, short of the journey.

Simonin's "Underground Life."

We have mentioned the receipt, from H. H. Bancroft & Co., of a copy of this splendid production, the largest and most superbly gotten-up work on mining in the English language. It is translated from the French, and added to by H. W. Bristow, F. R. S., of the British Geological Survey; the French work, "*La Vie Souterraine*," having been before the public for some little time.

"Victor Hugo," says the author in his preface, "has recently described the struggles of the sailor in "The Toilers of the Sea." What he so happily calls the irrepressible power of the Elements, addresses itself alike to the Mariner and the Miner, for each is the soldier of the deep, against whom the powers of nature wages at times their utmost fury."

"The first part of the present work is devoted to Coal, a substance indispensable to all civilized nations; the second to Metals, the origin of all progress; the last to the Precious Stones, which play so important a part in the decorative arts. The intrepid coal-miner, whose advent is but of recent date; the veteran of the mineral world, whose origin dates from the dawn of history; and the patient seeker after gems—are the types of industry we have to consider."

"Underground Life" is large octavo in form, pp. 516, printed on the best quality of paper, and is illustrated by real artists, in the designing as well as in the work of the wood engraver. There are 160 engravings, many occupying nearly a whole page, illustrating interesting underground scenes, and all the tools and machinery that the miner has to do with; twenty maps geologically colored, representing the great coal fields of the world, and the metalliferous regions of Chili, California and Novada, Lake Superior and Australia; besides ten chromo-lithographic plates representing all the minerals commonly met with as ores, with their crystallized forms. The first half of the hook is devoted to coal. In the latter half, devoted to metallic mines and gems, are, amongst the valuable matter, quite a number of vein sections showing the different character of some of the noted ore deposits of the world.

The social and ideal features of underground life seem to have been kept in view by the author throughout the entire work; making it entertaining as well as instructive, an agency calculated to inspire at once an interest in mining on the part of those unacquainted with its realities, and pride in those who are carrying on or aiding in its engineering operations. It is such a work as one would make a present of to an ambitious youth whom we would make sure of intoresting in matters worthy and substantial. To Californians, Simonin's book is valuable, because it contains excellont descriptions, not only of our own North American mining fields, but of Mexico, South America, Australin, Russia, etc. Though covering in general the same ground as J. Arthur Phillips' new hook, "Mining and Metallurgy of Gold' and Silver," the treatment is so different, that the same ground is apparently never covered, and tho sources of information and observation drawn from appear to he so independent as to render both hooks a desideratum to the intelligent mining engineer of this coast, too valuable to he dispensed with.

In regard to the function of the precious metals, Simonin says :

"But if the common motals, especially iron, are so intimately hound up with the progress of civilization that the existence of a refincd state of society cannot henceforth be imagined without their aid, the precious metals, on the other hand, play a part in this world which cannot escape us. In consequence of their exceptional qualities, their rarity, inalterability, and weight, they have not only become the sole representatives of value; but they are also those which, at all times, have helped in the colonization of different countries, by the fascination which they exercise on the minds of the multitude.

The important part which they play in the life of the peoples is known: it remains to be seen how their history composes, to some extent, the very history of civilization."

The price of "Undergronnd Life" is $18.

Irrigation.

Immeuse expenditures are being made in India to secure tho benefits of a general system of irrigation. The land in Central India, snsceptible of such improvement, exceeds, by fully ono-quarter, tho entire area of the State of California. Thero are quite a number of ancient canals, formerly used there for irrigntion, hut now filled up with rubbish from disuse, which aro to he restorod, and great numbers of new ones are to bo constructed. At one locality, in Central Hindostan, an immense reservoir is being huilt, at a cost of not less than $450,000; while soveral important canals aro to he made to answer the douhle purposo of irrigation and navigation. Extensive embankments are also to he thrown up along the hanks of tho Ganges, the Irriwadi, and other principal rivers, to reclaim waste territories of overflowed land. Everywhere, indeed, throughout that magnificent country, where the hand of modern civilization has secured the occupancy and control, the refreshing and fertilizing element is to be compelled to flow over desert places, or restrained from its wnstofulness in regions where hitherto native skill has been insufficient to control the overflowing waters.

So large and urgent is the work to be accomplished that there is said to be a great demand throughout India for competent civil engineers; while there is work enough, in carrying out the contemplated improvements, to give employment to many thousands of men for a lifetime.

Should not we, as Californians, in considering these facts, hear in mind that we, too, have immense tracts of unreclaimed land, equally as fertile as the best in India, and equally as susceptible of improvement under the hands of the skillful engineer? Our position with reference to the corn markets of the world is much more favorable than that of our antipodes, and it should never ho said of such a people as are building up this great empire of the Pacific, that we have allowed the half-civilized, enervated races of the East to out-do or out-rival us in such important engineering improvements as those to which we are alluding. The Darien Canal project seems now to he in a fair way of realization. When that is completed, freight to New York and Liverpool will be materially decreased, and grain can be shipped in bulk and laid down in either city cheaper than it can ho produced and transported from any of the Mississippi States. With such advantages, California might and ought to send two hundred grain-loaded ships through the Golden Gate every month in the year, the aggregate returns from which would be more than four times our present annual yield of gold! Such is the harvest in store for California, within twelve or fifteen years, if her pooplo will only put themselves in readiness to take advantage of the means which nature has placed withiu their easy reach.

MINING IN MONTANA.—Accordiug to the "Montana Statistical Almanac for 1869," there are thirty-four quartz mills in that Territory, with an aggregate of 476 stamps. Only eighteen of these mills are now running. The total gold yield up to July, 1869, is set down by the same authority at $92,000. Prof. Blake, in his Paris Exposition report, sets down the total yield to January 1st, 1868, at $71,500,000, and adds an estimate of $12,000,000 for 1868, which would make a total of $83,500,000 up to the present year. Mr. Taylor, U. S. Commissioner, sets down the total yield to 1868 at only $37,000,000. Coal is said to exist in numerous localities throughout the Territory, several veins of which have been partially developed.

AIR BUBBLES IN OPAL.—Mr. Winant, late of Yaquina Bay, Oregon, has shown us a number of quartz specimens of a milky opalline variety, which contain air bubbles, or a gas which rises always to the top of the little translucent cavern that contains it. Quartz crystals not unfrequently contain water bubbles; showing that during the formation of the crystal from watery solution, both water and air may he inclosed. The peculiarity of the present specimens consists in the quartz being amorphous, and in their having outwardly a common resemblance to the shape of a small mussel shell. They appear to be silicious concretions formed around gaseous bubbles which were arrested under water, from some cause, long enough to enable a skin to he formed.

New Job Printing Firm.

In order to devote our attention more exclusively to the publication of our paper, and the business of our American and Foreign Patent Agency, we have disposed of the presses and job printing material, and fixtures, in our office—with the entire future good will and patronage of our JOB PRINTING OFFICE,—to George Spaulding and Harrison Barto. Messrs. Spaulding & Barto will continue the operation of the same, in our office, 414 Clay street, under the title of "The Mining and Scientific Press Job Printing Office."

Both of these gentlemen are practical printers of good attainments and enviable reputation. They have been long engaged in this office, and it is with pleasure that we can recommend them to the favor and patronage of all our old customers in the line of Job Printing.

A. T. DEWEY.
W. B. EWER.

P. S.—This change relates to our job printing department alone, our patent agency and newspaper business remaining as before.

DEWEY & Co.,
Mining and Scientific Press Office, 414 Clay street.
MARCH 1, 1869.

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. TAYLOR, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. HOWLAND.

[From the new "Dominion.]
At this season, when coughs and colds are so prevalent, an effectual remedy, and one easily obtained, is Perry Davis' Vegetable Pain Killer. It is no new nostrum, vended by unknown agents, but has stood the test of over twenty years, and those who use the article, internally or externally, will connect with it grateful recollections of its worthy inventor.—*Hastings' Chronicle, C. W.*

PAIN KILLER.—The testimonials borne to the efficacy of this valuable medicine are sufficient to warrant its introduction in every house. Our own opinion is that no family should be without a bottle of it for a single hour. In flesh wounds, aches, pains, sores, etc., it is the most effectual remedy we know of. A bottle will last for a very long time, and its low price places it within the reach of all.—*St John News.*

☞We are glad to learn that the "Pain Killer" is having so large a sale in our city. We have every reason to believe it to be an almost never-failing cure for pain, and a medicine that no family should be without.—*Montreal Pilot.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

SILVER COMET
Mining, Mill and Tunneling
COMPANY,
White Pine District,
NEVADA.

This Company's claim adjoins the celebrated Virginia Mine, on TREASURE HILL.
From its outcroppings and the richness of the Virginia and other mines which have been opened in the immediate vicinity, the prospective value of this mine is not exceeded by any in the District. With a view to the immediate and vigorous prosecution of work in opening this mine, the Board of Trustees propose to sell a limited number of the reserved UNASSESSABLE Shares of Capital Stock at the nominal price of $2 50 per share, the entire proceeds of which will be devoted to developing the mine.
Only **1,000** Shares will be sold at the above named price, and a portion of that number has already been engaged.
In issuing Stock the subscribers will take precedence in the order of their names.
The Books of the Company are now open for subscription at the Secretary's office, 417 Kearny street. By order.
12v18-1t IRA G. HOYT, Secretary.

To Quartz Miners.
Having a new system of Amalgamation, styled the
PAUL & WOOD ELECTRIC PROCESS,
And which has been so fully tested as to be worthy of your consideration, I now invite it, relying only on the precious metals produced, cheapness and simplicity of machinery, to gain favor for it.
Parties having mines containing a high percentage of gold and silver, but which cannot be obtained, on account of fineness, or rebellious character of the ore, will do well to investigate. Attention given to communications.
Address, ALMARIN B. PAUL,
408 California st., or Miners' Foundry,
11v18-1m San Francisco.

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hunsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

Resources and Developments.

MEXICAN INTERNAL IMPROVEMENTS.—The *Bulletin's* Acapulco correspondent says: All the late acts of Congress and public decrees tend to favor a few, and aim at cheap popularity. In the City of Mexico they are going to open a new avenue, to be called "Avenida de hombres illustries," and to be adorned with the statues of Columbus, Morelos, Hidalgo, etc. The new steamboat "Guatomatzin" is now plying on the lake of Tescoco, which will be connected with that of Chalco. But when will the water of these lakes be deepened and the channel widened? To everything in Mexico the foundation is wanting. Numerous railroad concessions have been made, but the grants remain waste paper, because the funds are wanting to carry them out.

WOOLEN FACTORY AT SAN JOSE.—Within a few days a few enterprising gentlemen of San José have formed a company for the purpose of establishing a manufactory of woolen goods in that city. The capital stock of the company is to be $100,000, and already $50,000 have been subscribed and pledged. T. Ellard Beans, S. O. Houghton, R. Peckham, Daniel Murphy and J. H. Fliekenger, have been selected as the trustees.

THE SHIP BUILDING RESOURCES OF PUGET SOUND.—It is now certain, says the *Bulletin*, that a great ship building interest will be concentrated on Puget Sound. There are a thousand miles of shore line on the Sound, deep water, very few shoal places or rocks, easy of access in nearly all weather. The timber is there. But iron enters largely into the construction of ships. There is enough iron in Cowlitz, Lewis and Thurston counties to bind the earth in chains, with the mines yet scarcely prospected. The iron ore in the Black Hills, within fifteen miles of Olympia, is of as good a quality as can be desired, in exhaustless quantities, very near to both the Sound and Hood's Canal, and all it wants is capital and enterprise to make all the railroad iron the Northern Pacific Company will ever want. The iron ore of Lake Superior is conveyed as far as Pittsburg, where it is mixed with other grades to produce certain desirable qualities of iron; the distance between the two points is nearly the same as it is between Olympia and San Francisco.

BEET SUGAR.—A report on beet sugar production in Europe has been made by W. Wadsworth, agent of the Sacramento Valley Beet Sugar Co., to whom we are indebted for a copy. This company is understood to "mean business." The officers are W. E. Brown, President; Chas. Kleinserge, vice-President; Edgar Mills, Treasurer, and Sparrow Smith, Secretary.

ALASKA RESOURCES.—A Victoria correspondent says: The Alaska salmon fisheries will be eventually far more valuable than fur seal, owing to their fine flavor, large size, good color, etc. Sitka is not Alaska. Farther north, salmon weighing from 60 to 100 pounds can be obtained at comparatively no cost. Any company embarking in the business, and only curing the bellies, could make thousands of dollars yearly. The market would be the whole world, consequently it could not be overstocked. They are worth from 20 to 25 cents per pound, when the entire fish (salted) sells for four cents. Codfish are in abundance, and in other localities than where the schooners have been fishing for them.

DISTILLERY FOR NICARAGUA.—Col. Haraythy has shipped on the Mary Belle Roberts the machinery for a distillery in Nicaragua, valued at about $10,000. He has obtained exclusive privileges for carrying on this business, from the Nicaraguan Government.

PREVOST'S LOS ANGELES SILK COMMUNITY.—Mr. Prevost, late of San José, has located in Los Angeles, where his aim is to found a city of silk; and to gather the practical silk-workers around a common center, where suitable land can be obtained. The locality, we understand, is on the San Bernardino road, about thirty miles east of Los Angeles city. A number of others have joined Mr. Prevost, and large plantings of mulberry trees are in progress.

SAN LUIS OBISPO ASPHALTUM.—A contract has been signed between Mr. Lambert Menant, of Menant & Co.'s asphaltum works of this city, and Mr. Francis Branch, of San Luis Obispo county, to work the beds of asphaltum situated on the rancho of the latter, near the Arroyo Grande, about ten miles below the town of San Luis Obispo. According to the terms of the contract, as published in the *Republican*, Mr. Menant is to commence operations within three months from the signing of the same, and is to export from a thousand to fifteen hundred tons of crude asphaltum per annum, for

which he is to pay Mr. Branch one dollar per ton.

CALIFORNIA NUTMEGS.—Perhaps it is not generally known that the native nutmeg tree grows in the Sierra Nevada range of mountains in California, but nevertheless such is the fact. We have with our own hands picked them from the tree in the upper portion of Placer county, and about the head waters of Feather river, and after properly drying them, found them fully equal in point of strength and flavor, to those imported from the East Indies. Some nineteen years or more have elapsed since that time, and of course we are unable to describe with accuracy the nutmeg tree of California, more than to say that it resembles some of the species of pine, and in fact, most people would pass it by, as we did at first, without suspecting it to be anything else but a pine tree.—*San Mateo Gazette, March 13th.*

CRANBERRIES FROM OREGON, PUGET SOUND, KODIAK, ETC.—The principal supply of cranberries for this market is obtained from the plant in its wild state. In Illinois, Wisconsin and Michigan immense tracts of marsh land exist, upon which little or nothing else is produced. On the Pacific coast, the principal supply is obtained from the country bordering on Puget Sound, where it is gathered by the Indians and sold to traders in exchange for whisky and blankets. There is quite an extensive trade carried on between San Francisco and Oregon in this fruit. Considerable quantities are also imported from the Atlantic States, which command about ten cents per gallon more than those of Oregon. Although a large portion of the supply comes from Puget Sound, they are all known in the market as Oregon cranberries. Large tracts on Kodiak Island, of the Aleutian group, are covered with the cranberry vine, which produces fruit unsurpassed in size and flavor. The Kodiak fruit readily commands in the market from 15 to 20 cents per pound more than the Oregon. It is thought that the fruit could be afforded in the market for one-half the present price, and then leave a large margin for profit to the dealers. One favorable feature in the cranberry trade is the ease with which they are prepared for shipping. They are put into kegs and barrels into which sufficient water is poured to cover the fruit, when they are headed up, and are then ready for transportation. In this State they will keep for months through hot and cold weather unchanged.

COAL MINE ON QUEEN CHARLOTTE ISLAND.—The steamer *Otter* was to leave Victoria, V. I., about the 16th, for the northwest coast, to take up a squad of miners to Skidegete, on Queen Charlotte's Island, for the purpose of working a vein of anthracite coal. The coal company have expended considerable money during the past two or three years in developing this mine, and they are sanguine of having struck a good vein. They expect to place their coal in the market this season.

Gold having been found in many places, it is suggested that the prospecting of deep digging can be done to better advantage in winter than in summer, provided the ground be saturated with water, as in winter the surface water will be frozen, which would render sinking of shafts less expensive.

PROSPECTUS
—OF—
THE SALT POINT
SILVER MINING COMPANY.

This mine is situated on the western slope of Treasure Hill, about half a mile from Treasure City.

It is admirably located for working purposes, being on the hillside, at an elevation of six hundred feet above the flat or "swale" through which the road to Shermantown passes. The road is on an easy grade, about one mile from Shermantown, where the principal mills are located. The flat in front of the mine affords ample room for the dumping and piling up of milling ore.

The mine is surrounded by fine groves of trees of a large growth; the wood of which for fuel can be purchased at $8 per cord, and at a corresponding rate for timber for mining purposes.

The ledge lies favorably for working by a tunnel or cut, it is well defined, and apparently from ten to twelve feet in width. Assays of the rock are remarkably uniform in character, ranging from $350 to $385 per ton.

Work is now being done upon the mine, and it is believed that the sale of One Thousand Shares of Full Paid Stock at $2 50 per share will give all the working capital necessary for its development. The Company are now working the mine, through a shaft from fifteen to twenty feet in depth, and, so far as developed, the mine shows itself to be one of the richest and most extensive in this wonderfully rich District. Within a few days the owners have been offered for the whole mine $750,000, but prefer to sell a portion for working capital at a lesser rate.

Subscriptions received at the office of the Company, No. 211 California street.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to A. Pritzel's Iron Works, 203 Fremont street, near Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

THE ANCIENT CHINESE IN AMERICA.—It is a well known fact that the Chinese have, in their musty libraries of hy-gone ages, a narrative of travels in a country called Fusung, situated far to the eastward, and beyond the great world-ocean. This account is rendered definite and substantial by the accompaniment of a map—which can be seen at the Mercantile Library—representing, with a considerable degree of accuracy, the Pacific Coast of North America, including, as the most marked and recognizable delineation, the peninsula of Lower California. The same map represents the Atlantic side of the American Continent, but with such glaring inaccuracy as to make it evident on the surface that the authors drew entirely on their imaginations for their data. Owing to the difficult nature of the Chinese language, few of the details have been brought to light. It is now reported that Professor Carl Neumann, the linguist, late of Munich, but latterly of Berlin, who has interested himself specially in American historical questions, has ascertained, by the most incontestable proofs—the Chinese Year Book—that a company of Buddhist priests entered the Continent of America by the way of Alaska, a thousand years before Columbus, and explored thoroughly and intelligently the Pacific borders, penetrating southward into the tropical regions of the Toltecs and Aztecs, or the land of "Fusung," so called after the Chinese name of the Mexican aloe. California they examined carefully, but did not cross the Sierra Nevada. Ancient documents in the Chinese archives, detailing these discoveries, are to be translated.

RUBY VALLEY, in Nevada, is said to derive its name from the fact that rubies abound in the sands of the mountain brooks flowing through it. These are genuine gems, perfect in form and color, and wanting only size to render them valuable. They have the peculiar octagonal shape of the crystallized quartz, and their size varies from that of a pin's head downwards.

Valuable and Popular Practical Books.

Painter, Gilder, and Varnisher's Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Varnishing, and Glass Staining, with numerous Useful and Valuable Receipts; Tests for the Detection of Adulterations in Oils and Colors, and a statement of the Diseases and Accidents to which Painters, Gilders, and Varnishers are particularly liable, with the simplest methods of Prevention and Remedy, with directions for Graining, Marbling, Sign Writing, and Gilding on Glass. To which are added Complete Instructions for Painting and Varnishing. 12mo, cloth..... $1 50

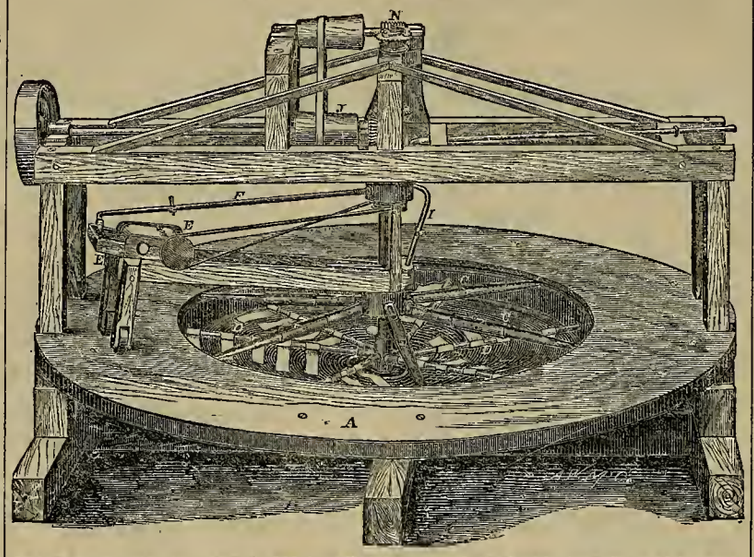
ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFCATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE, at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

13v16eow

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

HORACE MORRISON, Secretary,
Office, N. E. cor. Front and Jackson streets.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principlo excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1vl San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

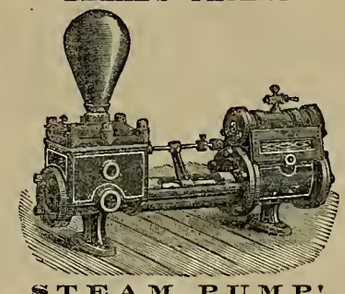
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

21v16-3m W. McKINDLE, Manage.

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoadrinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

6v18-1y

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MECHANICAL AND ARCHITECTURAL
Drawing School
—FOR—
APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. **414** CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

1v18.tf

Engineering.

BRINGING WATER INTO OAKLAND.—The "California College Water Company" has appropriated several springs and rivulets in the hill back of the University ground, now belonging to the State College, and is asking of the Supervisors of Contra Costa the privilege of taking, at prices to be fixed by public appraisement, the water from the San Pablo and Sobrante ranches, aitnated eight miles north of Oakland. The artesian wells of Oakland do not overflow, and are said not to be unsatisfactory. It is expected that the growth of Oakland will make the water supply franchise valuable in time.

RECLAMATION OF SWAMP LANDS BY STEAM POWER.—The acquisition of correct knowledge as to the depth and duration of overflow of swamp lands, is the first step to reclamation; and the next is the construction of a dike high enough at least to keep off the ordinary floods. The Sacramento *Union* quotes the *Alta's* description of the Fowler steam plow driven by a stationary steam engine, and adds that it is just the thing for diking and plowing the tules. The *Union* says: "Generally the tules lands on the sloughs of the San Joaquin and Sacramento are submerged from two to three feet in average winters, and not exceeding six feet in extraordinary floods. This may appear to be a rash statement, yet its truth will be apparent when it is known that the highest point attained by the great flood of January, 1862, at the city of Stockton, was but eleven feet eight inches above low-water mark at ebb tide. There were no tule lands between Stockton and Snisun Bay which would not have been fully protected from that extraordinary flood by dikes eight feet above the natural level of the land. Against ordinary floods, embankments of five feet would suffice. Yet even these are not expensive to be thought of in any system for general reclamation, when the work has to be done with pick and shovel, with labor at its present rates. It is true small farms have been so reclaimed—some as large as fifteen acres—in every case paying well, though at a low estimate the land so reclaimed can hardly have cost less than $250 per acre. No lands in the United States are as prolific and unfailing."

RAILROAD IN PERSIA.—The shrill whistle of the railway engine is soon to be heard in Persia. The Shah has granted to a company of Englisb capitalists the exclusive right to construct railways in the country for a period of twenty years. These capitalists begin operations with a short road extending from the capital to the suburban village of Rey, a famous weekly resort of pious Teheranlees. Ground has been broken, and the engineer employed estimates that the line can be constructed and stocked for less than $500,000, on which the passenger traffic of some 40,000 devotees a week will, he reckons, yield a remunerative dividend, exclusive of an eight per cent. guarantee.

RAILROAD AND MINING EXPLORATIONS.—Mr. John Nystron, who lately published a report on his previous expedition into the interior of Peru, has been supplied by the Peruvian government with funds for setting out on an exploring expedition in the direction of Chanchamayo, the object of which is said to be the opening up of the country, and to report as to the feasibility of connecting those distant regions with Lima by means of the iron horse. Another well known gentleman, Mr. Josiah Harris, has been engaged by Government to make mineralogical researches—there being a belief of the existence of extensive coal fields to the north, not very far from the capital.

BUILDING RAILROADS OVER THE ALPS.—Mr. Fell, an English engineer, has offered to the Swiss Federal Council to undertake the construction of their railroads over the Alps for a guaranteo of interest of 600,000 francs annually. He estimates the cost of that over the Simplon at from eleven to thirteen millions; of the St. Gothard at from thirteen to fourteen; and at fifteen to eighteen for the Luckmanier.

BRITISH-AMERICAN OVERLAND WAGON ROAD.—At a recent people's convention held in British Columbia, resolutions were adopted setting forth a scheme for the construction of an overland wagon road from Lake Superior to the head of Fraser River—the expenditure to be guaranteed by the British Government. A road from the head

of Lake Superior to the Red River settlement is now being made at the expense of the Canadian Government.

SOUTH AMERICAN RAILWAY PROGRESS.—The present Peruvian government is doing all that it can with respect to railways and other public works. The two railway lines actually in construction from Arequipa to the coast, and from Lima to Huacho are being actively proceeded with, and the latter line, it is stated, will be opened as far as Chancay, by the end of the year. The proposal presented by Mr. Meiggs, the railway contractor, to take a survey and make the preliminary tracings for the prolongation of the former line to Puno and Cuzco has been, moreover, accepted. Orders have likewise been given to make a survey of a line that will join the city of Tacna with Puno and the frontiers of Bolivia via Lake Titicaca.

TELEGRAPHIC ITEMS.—It is expected that the Western Union Telegraph Line will be in working order through to White Pine in the course of two weeks. The operations of construction have been considerably retarded by the snow.

It has been definitely decided to land the American end of the French-Atlantic cable on a high knoll on the Duxbury shore, in Plymouth county, Massachusetts. From Duxbury the cable will communicate with New York by means of land wires. The Great Eastern will cross with the cable in June—sailing from Brest and convoyed by a fleet of French naval vessels as tenders.

More than 3,000 miles of telegraphic cables have been laid in the last year, as appears from the following list: From Malta to Alexandria, 920 miles; Tasmania and Australia, 205 miles; French Atlantic cable, 700 miles; Baltic Sea, 320 miles; Persian Gulf, 500 miles; Swedon, Norway and Italy, 100 miles; from Denmark to Newcastle, 340 miles; between Cuba and Florida, 120 miles. The projects for a further increase of lines are abundant also, and during the year 1869 it is not unlikely that quite as many miles of cable will be laid as during the year 1868. Furthermore the Indo-European Telegraph Association contemplates a double wire line overland from Nordenoy through Prussia, Russia, and Persia, as far as Teheran, to connect with existing cable lines; and the Anglo-Mediterraneau Co. means to extend the present telegraphic system by a cable to run from Suez, through the Red Sea, to Aden, and thence to Bombay. A line of cable between Cuba and Jamaica, and Panama, is also contemplated, and another from Scotlane to the coast of Norway.

SCIENTIFIC EXPLORATION AND TRAVEL, as a road to distinction, has been amongst educated and titled Germans, possessed at the same time of wealth, ever since the youth of Humboldt. An expedition of scientific men has just started out from Vienna to explore Eastern Asia and South America. The object is commercial as well as scientific, and is pursued under the authority and at the expense of the Austrian Government. Karl von Scherzer is the chief, who goes by way of Egypt, the East Indies, China and Japan, thence to San Francisco, and from here to Buenos Ayres. He left Vienna on the 20th of last December.

ROMAN MORTAR.—The mortar used in the Roman aqueducts, still in existence, was, it is said, composed of pure lime mixed in large proportions with fragments of brick coarsely powdered. These dry fragments absorbed the moisture, and hastened the solidification of the mortar.

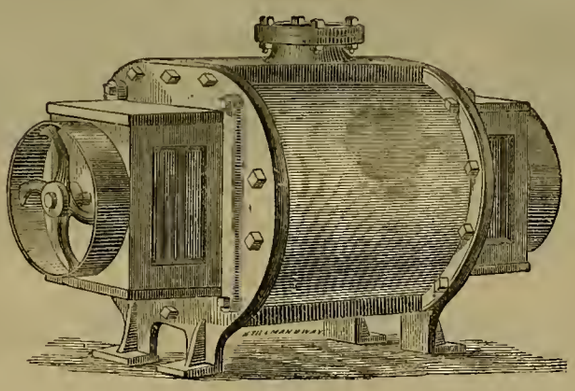
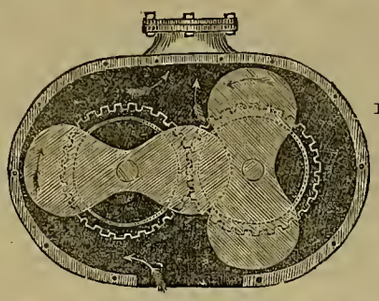
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

New Inventions.

SAFETY HOOK.—We were recently shown a new style of safety hook, the invention of Andrew Peasley, of this city, which is far superior to any hook of the kind we have ever seen. It is absolutely impossible for any bucket to become detached from it by any kind of accident that can happen in the course of lowering or hoisting, and at the same time it is so strong and simple in construction that it is impossible for it to break or get out of order. Cages being in use at all of our principal mines, there is little demand for the hook here, but in White Pine, where buckets, whims and windlasses are everywhere used, the hook would be most useful. A specimen hook will be sent out to White Pine to-day.—*Enterprise.*

A SAILING VELOCIPEDE.—An improved three-wheeled velocipede, with a mast and large square sail, was navigated over the Point Lobos road lately, and attracted much attention from its nondescript appearance. The machine was managed by its builder, Mr. David R. Smith, who made good time, up hill or down, and particularly when returning to the city with a favorable wind. In dimensions it is about nine feet in length by five in breadth, and not unlike a light-wheeled buggy. The hind wheels are four feet in diameter, and the forward one about thirty inches. In its management the sail and forewheel are both adjusted by cords attached to the driver's seat. When the sail is set the view ahead is nearly obstructed, but by means of two large holes or eyes, cut in the canvas, at about the hight of the head, the vehicle is directed with safety. An application for a patent has been made for this unique contrivance.—*S. F. Herald.*

SWEET JUICE OF THE GRAPE.—Dr. B. F. Headen of Santa Clara, claims to have discovered a process by which the juice of the grape can be kept without fermenting, for years. This wine is said to be entirely free from alcohol, and properly corked in bottles, will keep perfectly sweet. Dr. Headen proposes to manufacture this wine for sacramental purposes in the churches.

IMPROVEMENT IN GUIDE FOR SEWING MACHINE.—William H. Van Vlear of Stockton, has obtained a pateut for a valuable improvement in guide to be used with the "presser-foot" for sewing machines. The nature of the invention consists in providing the guide with a clasp or turn at the toe, and two flanges projecting upward, one from either side, inclining slightly toward each other, except at the extreme top edges, where they flare a little, for the purpose of adjustment to the foot, so that when adjusted to the foot the clasp hooks over the toe, and the flanges clasp the sides of the foot, thus holding the guide firmly thereto, without further fastening by means of screw or otherwise.

GRAPES PERENNIAL.—H. C. Shattuck, who owns a fine vineyard about three miles from Woodbridge, claims to have discovered a cheap and efficient plan by which the market may be supplied with grapes throughout the whole year.

PHOTOGRAPHY AND THE PRINTING PRESS. The Court Photographer of Munich, J. Albert, is said to have discovered a process by which he can multiply copies of all sorts of photographs to any extent through the press. The smallest and largest pictures can be re-produced with great rapidity, as perfectly as by the old process. Large supplies of favorite pictures can be furnished without regard to the state of the weather, and in a very brief period of time. Albert's photographs of the renowned pictures in the two Pinckotheks, and of Kaulbach's productions, are sold throughout the world.

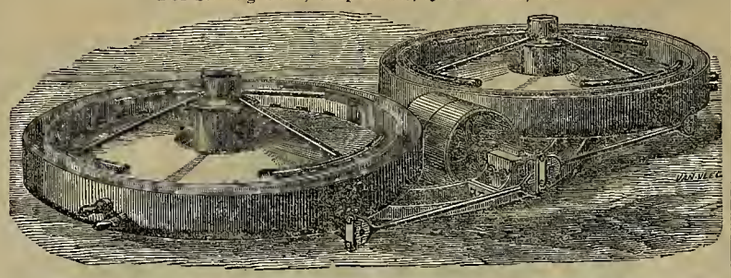
PETALUMA WATER VELOCIPEDE.—An inventor at Petaluma, whose name is not given, has attempted the construction of a water velocipede which is described as follows in the Petaluma *Journal* of the 11th:

The machine is about twenty feet long, and consists of three barreled-shaped air-tight drums, resting in the water, two aft and one forward, on the surface of which are paddles, about four inches wide, at intervals of eighteen inches. Between the drums there is a crank, which is attached to the drums by means of bells. Afloat and in motion, it has the appearance of three great barrels possessed of internal powers of locomotion. The drums draw about seven inches of water with six men aboard, are capable of floating many tons, but in his calculations of speed, the inventor was somewhat disappointed.

A DISPATCH of yesterday, March 19th, reports that the Union Pacific Railroad track has been laid fifteen miles this side of Ogden.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prator Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four or them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

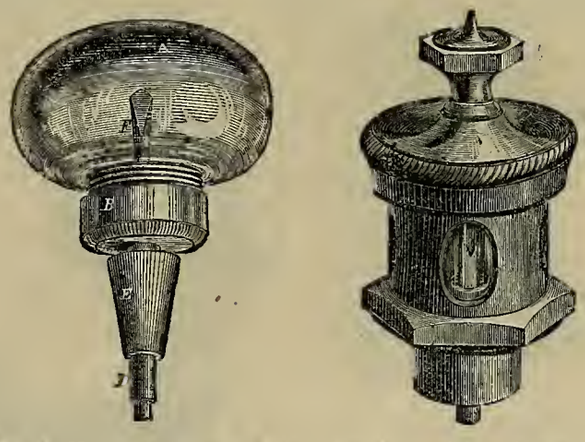
GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

18v17eow

THE STANDARD OF AMERICA.

DREYFUS' PATENT SELF-OILER.



For Locomotives, Marine and Stationary Engines, Fans, Pickers, Looms, Carding and Spinning Frames, Lathes, Saw Frames, Shafting, and Machinery of every description.

A Saving of from 75 to 95 per cent. Guaranteed.

They are composed of a Transparent Glass Cup, mounted in Britannia and Brass, provided with a hollow tube, inside of which is placed a loose-acting solid wire, which acts as a Feeder and Regulator. The wire rests constantly upon the journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion. They are as reliable in winter as in summer, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum in them, as this has been proven by two years' constant use. They are constructed in a very neat and substantial manner. We spare no pains in making them as perfect as it is possible for them to be made, and GUARANTEE them to give perfect and entire satisfaction.

DIRECTIONS:

Fill the cup full of oil, then screw the cap down air-tight. Place the tube in the oil-hole in an upright position, or upon an angle of 45 degrees. Permit the rod to have a perfectly free action. If you desire to have the oil flow faster, reduce the wire.

REFERENCES:

For the convenience of persons desiring references, we annex the names of a few Manufacturers and Railroad Companies, who are using the Dreyfus Patent Oiler in different parts of the country: San Francisco—Mission Woolen Mills; Pioneer Woolen Mills; Pacific Woolen Mills; Golden State Foundry; Ætna Foundry; Fulton Foundry; Empire Steam Mills; San Francisco Gas Co.; Mechanics' Mills; Bacon & Co., Printers; Bosqui & Co., Printers; B. F. Sterrett, Printer. Sacramento—Union Iron Works. Stockton—Globe Iron Works.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive

Light for Hydraulic Mining.

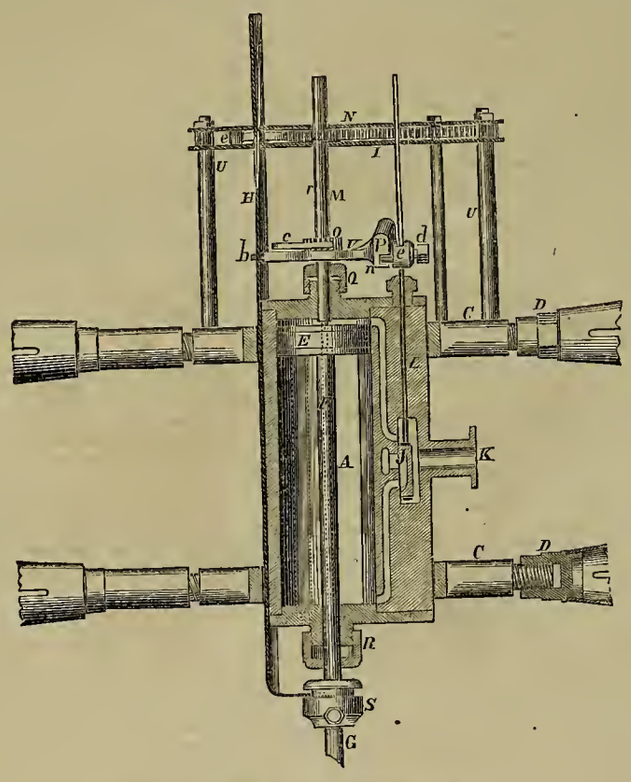
H. C. Kelsey, of Dutch Flat, inquires whether there is in existence any lamp or illuminator by which a hydraulic miner can throw light upon a bank at a distance of 200 feet, sufficiently strong to work by. Besides the very expensive electric, fresnel, and the calcium lights, the only practicable lights that we are aware of are the kind used in front of locomotives, and the benzine lamp of Mr. John J. Hucks of this city. The locomotive lamp itself is not different necessarily from an ordinary argand burner, its principal feature being the parabolic reflector, which throws a cylinder of light in any direction that may be desired and to a great distance. The cost of this paraholic reflector alone is about $100, that of the lamp being inconsiderable. Particulars may be learned from any railway engineer, or from Conroy & O'Conner of this city, metal importers, who deal in articles of the kind. Several of these, at 200 feet distance, would answer the purpose, but would of course, be exposed to danger from caving. A cheap light, which cannot be put out even by a gale of wind, nor by very copious sprinklings of water or rain, is Mr. Huck's benzine light. This costs $5, and lights to read by at a distance of 30 or 40 feet. A number of them might be stuck into a bank; and a little tumbling and battering would not do them much injury. The cost for oil is about the same as for a wood fire, or five cents an hour. Benzine, being a light oil, is pressed through the burning orifice by giving it a head of about two feet, while the heat from burning converts it constantly into gas as fast as used. This lamp, we understand, is used in hydraulic mining at Moorestown, Bidwell's Bar, and other places.

ONE of Mr. Paul's new dry amalgamation barrels, made of iron, was shipped from the Miner's Foundry, on Thursday last, for Mr. Chapin's mill at Silver City. It measures 4 feet in length, 38 inches in diameter, and will work 1,000 pounds. Underneath the cylinder is a common wood fire-place, which, with the cylinder, is inclosed in sheet iron; and at the top there is a common stove-pipe. The apparatus is very simple, and cheap. Mr. Chapin states that he has found this process to work his ores for from $14 to $18 less than by the common pan process.

Phillips' Improved Rock Drilling Machine.

The object of the invention herewith illustrated is to provide an improvement in the machine drill, for drilling rocks, for hlnsting purposes, etc. The machine consists of a cylinder and piston for employing either steam or compressed air for actuating the drill. The improvements consist in certain mechanical devices for controlling and regulating the operation of the drill, which we will endeavor to make intelligible by reference to the accompanying engraving.

The machine, as represented, is intended to work downward. The four lateral arms terminate in screw-jacks, as shown at D, for the purpose of fixing the machine firmly to the walls of a tunnel or to any suitable framework of wood, according to the work required.



PHILLIPS' IMPROVED ROCK DRILLING MACHINE.

The drill and drill-holder are seen at G and S, while the set-screw, which holds the drill firmly in place, is seen on the drill-holder, but not lettered. The cylinder A is so adjusted by finished contact with its supports and properly arranged feed-screws, and other mechanism not shown, as to slide forward with the progress of the drill in its work. This feed motion is maintained through the cog-wheels supported between the two plates N and I, and the shaft shown at the right of the engraving, between I and U. The piston-rod F, of the piston E, is hollow, and incloses the reduced prolongation of the ratchet-rod M, which latter fits steam tight, in the stuffing box Q. The object of this ratchet-rod is to rotate slowly the drill G, whereby the edge of the drill is presented to its work in a different radial direction from the preceding one, at each successive stroke.

The drill, piston-rod, piston and ratchet-rod, all rotate together. This motion is effected by the ratchet-pinion O, actuated by the spring and pawl C, and all operated by means which will become apparent from the following:

H is a slide-bar which has a vertical motion, properly guided, by means not shown. This motion is imparted by bringing the lower end so as to fit loosely in the groove of the drill-holder S, in such a manner that the rod must move up and down with every stroke of the drill. The object of this motion is primarily to operate the valve J, which admits the air or steam for actuating the piston E. This is accomplished by means of the lever V, which works in easy contact with the ratchet-rod M. This lever, which also bears the pawl and ratchet-pinion, already mentioned, is moreover caused to vibrate backward and forward by means of a diagonal slot, partially shown near the top of the slide-bar H. The ratchet-wheel is held from lateral motion on the rod M, by a set-screw, the point of which enters a longitudinal slot in the rod. By this slot and set-screw the ratchet is permitted to move along on the rod M, with the lever V, while the cylinder is gradually moved forward, as it is, in following up the progress of the drill.

The end of the lever V, which is opposite to the end b, is formed with a slotted head, not distinctly shown, but running diagonally upwards, and in which slot a stud-pin or projection from the blocks e is made to work—the said block e being firmly clamped to the guide-rod L by the set-screw d. By this arrangement, a modification of the movement of the ratchet-rod M is conveyed to the guide-rod L, just sufficient to work the valve J.

K is the steam induction pipe; the eduction pipe is not shown. When the cylinder has descended to the length of its limit, it is again elevated to its first position by means of a crank readily adjustable on the top of the set-screw, which is a prolongation (not shown) of the pinion-rod between I and U, upon the right of the engraving.

This device was patented by George Phillips, December 1, 1868. The inventor proposes for ordinary tunnel work a machine weighing about seventy-five pounds, having a cylinder six inches in diameter, and the piston eight to ten inches stroke. Its length would be three feet, without the drill. It is so adjustable as to be calculated to drill in any direction, for which purpose it will be observed that the lateral arms are made shorter upon one side than on the other. The inventor says from 300 to 500 strokes can be made per minute, and estimates that one machine will do the work of twenty men. Mr. Phillips is a working miner of long experience in Europe and the Eastern States, and is now engaged at Alleghany, Sierra County, California, where parties can address him. He is desirous of disposing of the whole or a part of his invention to some one who has the means to introduce it into use, and thereby secure a fortune and benefit humanity. He guarantees to satisfy any party who will interest themselves in the matter, of the entire practicability of his invention.

RHIGOLENE.—Considerable quantities of this highly volatile liquid are now being manufactured for commercial uses. It is the lightest of all known liquids, and in many respects is a very remarkable substance. Its specific gravity is 0.625. It is so volatile that a small portion poured upon the warm palm of the hand produces a hissing sound, very similar to pouring water upon hot iron; it almost instantly vanishes into vapor. It has so little odor that an ounce of it evaporated in a close room will scarcely be noticed. It is manufactured in Boston, and put up in packages of from one pound to five gallons each.

RECEIVED.—Vick's Illustrated Catalogue of Seeds for 1869 (James Vick, Rochester, N. Y.) It contains accurate description and illustrations of the leading floral treasures of the world, with plain and full directions for sowing seed, and transplanting and cultivating; also a similar list of choice seeds for the vegetable garden. Furnished by the publisher for ten cents in currency or postage stamps.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press.

Origin of the Washoe Pan Process.

"Let justice be done though the heavens fall."

This is an admirable motto, and if others would observe it as they desire to have folks think they do, I would have more justice extended me. In your issue of 18th, "J. S." uses the above motto, but endeavors to put forth as incorrect, my assertion respecting the Washoe Pan Process, and would have the reader believe I was detracting from Captain Hatch that which was his due, and appropriating it to myself.

The writer evidently is less acquainted with Captain Hatch, and certainly less with the early history of Nevada, than your humble servant. He says, "what is known as the Washoe Pan Process, was first introduced by Captain Hatch, at Col. French's mill in Silver City, *about* the same time as that above,"—meaning my introduction. Now the facts of the case are, I built two mills, one a 24-stamp (and the first for working the silver ores in the State), and a 48-stamp one—as I was using Patio chemicals—before ever Captain Hatch came to Nevada. As to the pans in French's mill, they were in previous to Mr. Hatch going there. What Captain Hatch did try to introduce, was the use of dissolved sulpbate of copper and salt, as a "process," and he tried to sell the same to me.

Not knowing at the time what his process was, I invited him up to the Gold Hill mill to *work a pan* against me, which he did. We cleaned up, and without waiting to see fully the result, but knowing by the hulk of amalgam that I had beat him, he remarked that "I did not want his process." He knew what I was using—salt and copper. Captain Hatch was a fine worker of metals, and I would he the last one to appropriate to myself anything due to him. He, however, *never worked iron pans in Mexico, or the Washoe Pan Process*, as I had many talks with him on the subject. As to the iron pans in use in Europe and South America being the same as the Washoe pan, there has been no nearer approximation than the Hungarian bowl or Bartola pan, which I have excepted, provided they can be called pans. In South America and Mexico, a copper pan was brought out about 200 years ago; but even that was not the Washoe system.

If the gentleman had read my article, in order to "do justice tho' the heavens fall," he would not try to make it appear that I undertook to claim the origin of pans, or the use of pans, as I knew too well that pans were used in California, and yet not "as thick as blackberries." It was "up hill" work to introduce them in gold milling, when I introduced them in the silver mines.

If J. S. refers to the use of copper and salt as the Washoe process that was known all over the mining world over 200 years before Captain Hatch was born, I would ask J. S. what he calls the Washoe Pan Process?

At the same time that I hold a very great regard for the many highly educated foreign gentlemen engaged in mining pursuits on this coast, yet this thing of everything being either French, English, German, or some other country beside our own, or that we are not capable of originating anything new or valuable to the mining interest, "is about played out."

ALMARIN B. PAUL.

COCOONERY EXPERIENCE.—A lady in Anaheim, who had raised a fine lot of cocoons from her own feeding, was somewhat surprised, a few days since, to find on the under side of each, a very fine perforation, through which the small red ant had entered and devoured the silkworm. Not one of about a thousand cocoons had escaped the little intruders. This experience may be of value to some of our silkworm growers.

Means of Promoting the Production of the Precious Metals.

ENCOURAGEMENT OF VEIN MINING.

[We find the following, under the above head, in Professor Blake's Report on the Precious Metals at the Paris Exposition:]

In view of the continued decrease in the production of gold from placer deposits, it becomes important to encourage and promote the extraction of gold from veins in every possible way. There are other great reasons for encouraging vein mining enterprises. They are permanent in their nature, and promote the general development and prosperity of the country by attracting a fixed population, composed of artisans, agriculturists, and others. In California, thriving towns and villages spring up around the quartz mines in the interior, where, without the mines, all would be comparative desolation. The superficial placers in California and elsewhere are soon worked out and deserted, and the placer miners are constantly roving about without fixed homes or property. It is somewhat different in regard to the deep placers and cement mines; they partake of the nature of permanent vein mines, yet are not so attractive as centres of population.

It is an extremely encouraging fact that vein mining in California and Australia is now, or at least was in 1866, more successful than at any former period. The number of successful vein-mining enterprises is increasing. In Australia, this branch of mining appears to have been extraordinarily developed, and to be followed to relatively greater extent than in California.

* * * * * * *

GOVERNMENT PROTECTION REQUIRED.

It is a primary duty of the government having a public domain of such great extent and wonderful richness to foster and protect mining enterprises, not only in order to promote the production of gold, silver, and ordinary metals, but as one of the best means of stimulating immigration, settlement, and the march of industry in all directions. Mining considered in its importance to the wealth of the country, is an interest which cannot be neglected in legislation without serious loss.

The veins of gold, silver, and other metals should be regarded as the heritage of the people, and while these veins should be left free to all who choose to work them, they should not be completely abandoned to hap-hazard destructive development. The government should exert over them an intelligent protecting and directing care, and adopt such laws and regulations as will best promote permanent successful mining, preventing waste, the loss of precious metals by careless and ignorant working, the complication and conflict of titles, and the holding of claims for merely speculative purposes, without any efforts being made to open and work them.

Nearly all the great exhibitions of mineral products in the Exposition illustrated the value of government direction and regulation of mining industry. The most satisfactory and perfect exhibitions were those made under the direction of government mining engineers. The collections were methodical and complete exhibits of the mineral resources of each country, and they were accompanied by maps and sections of mines in detail and by statistical publications prepared with the greatest care every year. The relations of position of the veins of ores and of beds of coal to the geological formations were shown by geological maps and sections and by models on a large scale, showing not only the inequalities of the surface of great districts of country, but the position of the coal beds below the surface, and the location of every mine.

By fostering mining enterprises and by thoroughly educating and training men to conduct them, many countries, whose resources in the precious and other metals are comparatively meagre, are successful producers of gold and silver from ores and veins such as in the United States would not be regarded as worth the labor of working. Every portion of an ore is utilized, and valuable products are obtained where without science and skill they would be wasted in residues. It has been shown in these pages that gold ores produced upon the slopes of the Rocky Mountains and found to be "rebellious"—difficult to work—have been transported with profit, in a partly worked state, over the immense plains and across the whole breadth of the States east of the Mississippi, and then shipped across the Atlantic, to be successfully worked at Swansea, in Wales, simply for the want of a proper development of metallurgical science and industry in the United States. We must not lose sight of the fact that we not only send some of our ores abroad to be worked, but that many of our young men are also sent abroad to obtain that thorough education and training in government institutions which they are unable to obtain at home.

IMPORTANCE OF A NATIONAL MINING COLLEGE.

The establishment of a national college would be one of the best or most effective means of securing the proper working of the mines and of promoting permanent and profitable mining enterprises, and thus tend to maintain a large production of the precious metals, especially from veins and deep placers, or whenever capital and skill is required. The dissemination of accurate information regarding mineral veins and their contents, and upon the various methods for extracting and reducing the ores economically, would prevent much of the present ill-directed energy and expenditure of time and money, often upon localities where there is little room to hope for success. Such institutions are absolutely necessary to gather the teachings of experience and to place them in a form available to the many persons now interested and yet to be engaged in mining, and to the prospectors who are penetrating our unequaled mineral regions in all directions and are constantly discovering new sources of wealth. The country cannot do too much to sustain and encourage the men who are thus prospecting the unexplored and almost inaccessible portions of the public domain, and to whom we are chiefly indebted for the discoveries which have been made. We should not leave them to labor unaided, but should follow them by organized explorations, by careful examinations of the veins and mineral deposits which they discover, and by the speedy publication of reliable and full information upon them. One of the prominent features of a school of mines should be practical laboratories and metallurgical works upon a moderate scale, in which the students could take practical lessons in the working of ores by all the known and approved methods, including the mechanical preparation of ores, their concentration by water and by fire in furnaces, or their reduction in pans or otherwise. These laboratories would be miniature metallurgical establishments, where ores of all kinds, "docile" or "rebellious," would be received, experimented upon, and treated by the best methods, while the theory of the processes would be fully given and the chemical reactions explained, so that the students would obtain a thorough knowledge and comprehension of the principles involved in the chemical treatment of ores and be prepared to adapt themselves to other circumstances in which they might be placed when called upon to treat ores in regions remote from supplies. Such a government mining school would not only directly promote mining industry, but it would greatly increase the amount of exact scientific knowledge among the people, and thus promote, in the most effectual manner, general scientific education, the results of which would be felt in all our industrial pursuits.

It is gratifying to all the friends of mining industry to know that the establishment of such an institution is already engaging the attention of Congress. Foremost among its advocates is Senator Stewart, of Nevada, who in 1867 introduced and ably supported a bill for the organization of a National School of Mines.

CORPS OF MINING ENGINEERS SUGGESTED.

In connection with, and as partly growing out of, such a mining college, the government should organize and make provision for a corps of mining engineers, to be filled subsequently by the graduates of the college; the members of the corps to have rank and promotion corresponding with the grades of the corps of military engineers.

Such a body of thoroughly educated men should be charged with the duty of exploration of our mineral regions; with the collection of information upon them; with the preparation of reports upon mineral deposits, and memoirs upon mining and metallurgy, all of which would form the basis for publications at regular intervals, giving to the people such information as would best promote their interests and the national prosperity.

Engineers, so educated and sustained by the government, would be animated by laudable ambition and enthusiasm, and would be strengthened by an *esprit de corps* tending to their moral and æsthetic elevation. They would be in a position to give independent and reliable opinions and advice upon the value of our mineral deposits and the best methods of developing them.

Such an organization would open a new and inviting field to our young and enterprizing men, the graduates of schools of science, and others, who seek a career in the fields of science.

In view of the recognized necessity of thorough technical education to the highest industrial and commercial development of a nation, the organization of a national corps of mining engineers has an increased importance; for, as already argued in regard to the influence of a mining college, it would have an immense influence in promoting general scientific education, thereby causing an exact knowledge of the fundamental laws of nature to pervade the people, and giving them a greater power over our vast material resources.

Another great means of increasing the production of the precious metals is the construction of railways across the country, by which prospectors and supplies can be carried into the heart of what are now comparatively unexplored and unknown mineral regions; and by which machinery can be delivered at moderate cost to extensive regions already known, but remaining comparatively dormant for the want of rapid and cheap communication with the centers of supply both east and west.

ABRASIVE WEAR OF METALLIC CURRENCY.

Few, we presume, are aware of the extent of the decrease in the world's stock of precious metals, by the abrasion consequent upon the passing of coin from hand to hand, in ordinary traffic. According to a carefully prepared report of an examination instituted by the British Government on or about the year 1800, it was shown that the abrasion in an interval of ten years amounted, in crown pieces, to 3.28 per cent.; in half crown pieces, to 8.8 per cent.; in shillings, to 24.29 per cent., and in sixpences, to 38.22 per cent. It will be observed that the loss was greater in small than in large coins; owing, of course, to the increased amount of handling to which the former were subjected. The large aggregate loss of the world's stock of precious metals from the source alluded to, becomes strikingly apparent from the above exhibit. Was it not from the fact that the abrasion in the larger pieces is greatly modified by the employment of warrants in delivering orders, or some system of exchange, which allows such coin to remain almost always in bank vaults, the loss to the world from this source would be a most serious one. We are not aware that any similar investigation has been made by any other than the British Government. The question is one, however, which certainly deserves serious consideration, especially in a hard money country like California, where the coin is chiefly gold, a metal which suffers much more from abrasion than silver.

THE WISDOM OF PROVIDENCE.—The admirable fitness of things in nature, generally, and the wise adjustment of substances with regard to their usefulness, and their sanitary influences upon man and animals, is a matter which is often strikingly apparent to the most careless mind, and one which can never be overlooked by the more observant. The almost universal juxtaposition of coal and iron is a matter often referred to. The peculiarities of the oxides of the various metals and metalloids, which comprise so large a proportion of the earth's surface, is wonderful to consider. If the oxides of copper and lead were anything like as widely diffused as that of iron, the result would be most disastrous to animal life. The refreshing element of water would, in such a case, become a deadly poison. How wisely has it been ordered that the oxide of iron, the most useful and widely diffused of all metals, is almost the only harmless one! If carbonate of baryta had been formed as abundantly as carbonate of lime, animated life, as now constituted, could not have gained a footbold on the earth. Facts of this kind might be extended almost indefinitely; but there is no necessity for dwelling upon them. Yet it is proper that we should now and then reflect for a moment, to the end that the mind may be elevated from finite things to the great Infinite, who has so manifestly ordered all things well.

Mechanical.

HEATON AGAIN.—*Engineering*, which has from the first spoken disparagingly of the Heaton steel process, always giving good and sufficient reasons, apparently, for so doing, has a capital chance to laugh at that inventor in illustrating and describing a "wonderful furnace" of his devising. This furnace has been mysteriously talked about of late, and excited great curiosity among metallurgists; but has now, by the publication of the patent specification, become accessible to the public, and a subject for criticism. Nothing "hogus" in science or the mechanic arts escapes the critical eye of the journal aforesaid; and here is a chance, which, presenting itself so soon after the lively newspaper controversy about the Heaton steel, was not likely to be overlooked. A careful copy of the patent drawing is given to illustrate the invention (!); and *Engineering* finds an ample field for fun-making, in describing it, and quietly admiring the accommodating manner in which, for Mr. Heaton's sake, the gases disregard all the natural laws ordinarily in force. At last, "by way of further elucidation," Mr. Heaton's own explanation is appended. This caps the climax; for it is "confusion worse confounded." Unless *Engineering* is for once wofully at fault, Mr. Heaton is a mere pretender.

NEW PROCESS OF PREPARING PAINTS.—The French Government has ordered a commission to examine and report upon the following process for preparing paints, based upon the fact that they are chemical compounds, and not simply mechanical mixtures. When the pigment is merely ground and mixed with oil in the ordinary manner, particles will remain in spite of every care, which will cause the paint to blister when laid. But by this plan, the pigment is mixed with both water and oil. The water aids in its minute division, and by virtue of the principle of elective affinity it leaves the water and unites itself with the oil, leaving the water upon the surface. The latter is then drawn off, and the paint consolidated and pressed into a cake for use.

WATCH MAKING BY MACHINERY.—We clip a few paragraphs from the description of the Elgin watch factory, by a correspondent of the N. Y. *Evening Post*:

"Watch wheels are struck out from thin plates of brass or steel with a punch which leaves their edges round and smooth. Then a dozen in a pile, held together by an upright standard, which passes through the middle of each, are attacked by a furious little circular saw, which whizzes down the side of the pile, and then up again, cutting one tooth in each wheel as it passes. * * An atom of a circular saw, no larger than a pearl shirt button, cuts up garnets and rubies into cubes, each of which is turned in a lathe with a diamond chisel. Then a revolving microscopic drill bores the hole. This is polished by a steel wire charged with diamond dust, which revolves one way while the jewel whirls the other. The two combined make 15,000 revolutions a minute. * * Here are delicate sapphire knives, used for cutting brass, because they leave a polished surface. Here are pinions of axles barely visible to the naked eye, which the workman only handles with pincers and examines through a magnifying glass. They are made of wire,—fed to a hungry little wolf with muscles of iron and teeth of steel, which ravenously bites them off at proper lengths,—and turned in ridiculously tiny lathes. * * The Loudon *Illustrated News* insists that watches cannot be made successfully by machinery. The best answer lies in the fact that a hundred thousand watches are made annually in the United States. They are rapidly driving all grades of foreign watches from our markets. At the beginning of this century there were few watches or clocks in America, and those were imported. The enormous "bull's eye" watch, or the wooden clock six or seven feet high, resembling a coffin standing on end, was a rare luxury. Now we supply the whole world with clocks, even to the Island of the Sea and the farthest Indies. Ultimately we shall supply it with watches. In the long run, European hand labor has no sort of chance against Yankee machinery, directed by Yankee brains."

RELATION OF PISTON AND CRANK.—The following is from Mr. Porter's new work on the indicator: "The motion of the crank is supposed to be uniform, passing through equal arcs in equal times; the motion of the piston, on the contrary, is, first, scarcely two-thirds that of the crank, being to the latter in the proportion of 1: 1.5708, and, second, it changes at every point of the stroke. At the instant that the crank is on the dead center the piston has no motion. Then its motion, at first infinitely slow, becomes gradually accelerated, until the velocities of the piston and the crank are equal, when it begins to be retarded, the ratio of retardation increasing until on the opposite center its motion has ceased. But whether the revolution of the crank is uniform or not—as in fact it can never be absolutely, since then the fly-wheel would cease to act as a regulator, and might be dispensed with—the motion of the piston has a fixed relation to it, being equal (if we disregard for the present the effect of the angular vibration of the connecting-rod) to the versed sine of the angle which the crank makes with the center line."

SURFACE AND JET CONDENSERS.—"With jet condensers only a given amount of water is required for condensation, and to give more only needlessly lowers the temperature of the feed-water, besides throwing additional work upon the air-pump, without obtaining any real improvement in the vacuum. With a surface condenser a moderate quantity of cooling water outside the tubes requires a relatively large amount of tubular surface. Some engineers maintain that it requires as much cooling surface to get the heat out of the steam as it required of heating surface to get it in. The usual proportion of the former to the latter is about 2 to 3, or 3 to 4. A pair of engines working to about 2,000 indicated horse-power would, in moderately fair practice, require every hour the quantity of steam that would be evaporated from 900 cubic feet of water, or 15 cubic feet per minute. To condense this by injection, with water at about 60°, would require 350 cubic feet, or ten tons of water per minute. This water has to be lifted out again to the sea level, perhaps 10 feet or 15 feet, the work thus amounting to eight or ten horse-power. This amount of water pumped through a surface condenser would not require much power. But in surface condensation much more water is required and much more power is consumed. The power necessary for surface condensation may be very materially reduced by utilizing the momentum of the flow from the sea, which is entirely extinguished in the jet condenser by the rose of the injection-pipe."—*American Artisan.*

NEW PLAN FOR TESTING RAILS.—Instead of the established method for testing steel rails by dropping a ton weight upon them from a hight of eighteen feet, a 75-pound weight dropping four feet, is to be used by the Philadelphia and Baltimore Railway Company. It is now considered that to subject the rail to some thousands of blows from this comparatively light hammer, is a nearer approach to the treatment which it receives in actual service, than the old plan. The weight is so arranged as to be caught on the recoil by a pawl, so as to strike no short blows.

NEW METHOD OF TESTING LARGE PIPES. The usual practice has been to close the ends by caps and then force in water until the pipe was completely filled; but with large pipes, very strong caps were required, and there was a waste of time and of water,—thus largely increasing the expense. The new plan is simply to place within the pipe a core, of nearly as great diameter as the pipe itself, and then force in water enough merely to fill the space between the two.

NEW ALLOY FOR COIN.—The French mint authorities recommend an alloy composed of 835 parts of silver to 93 of copper and 72 of zinc for coin and silverware,—as being more homogeneous than the one at present in use, and not liable to be turned black by the sulphureted hydrogen or green by acide.

STEEL "LAID" ON CAST IRON.—Our best tailors' shears, household scissors, and smith's anvils are made of cast iron and steel. The molten iron is poured upon the steel in a mold, until the steel is brought to the proper heat,—that of welding or fusion, the surplus metal being allowed to escape—when the union is effected and the iron fills the mold.—*Scientific American.*

Scientific Miscellany.

Glycogen.

This substance, the "sugar-generator,"—as its name implies,—in the animal organism, stands between starch and dextrine, in its properties. Bernard prepared it in 1857, from the livers of animals fed entirely upon meat. The process is in brief as follows: The liver is cut into fine shreds and thrown into boiling water to coagulate the ferment,—then bruised, mixed with a little water, boiled and strained; a precipitate is then obtained with alcohol, which is filtered and dried. It is afterwards purified by divers re-precipitations and re-filtrations, until it resembles hydrated starch, in its appearance and its properties generally. It is changed into dextrine and then into sugar, by the same agents which change starch into those substances.

Bernard concluded from his experiments that the formation of sugar in animals should be divided into two parts,—one entirely vital, the other entirely chemical;—the first consisting in the production of the glycogenic matter in the liver,—the second in the transformation of it into sugar by means of a ferment. We find in *Silliman's Journal* for January, under the head "Notices of papers in Physiological Chemistry," an abstract of Bernard's paper on the subject, by Dr. George F. Barker, from which we quote:

"This ferment was at first supposed to belong to the liver, but finding that blood effected the change in a marked degree, Bernard referred it to this fluid. During digestion, the circulation is much more active, and the transformation of the glycogenic substance is correspondingly great; in torpid animals like frogs, on the other hand, where the circulation is slow, the sugar disappears from the liver, while the glycogenic substance remains. If these animals be warmed, however, the sugar reappears, and so on alternately. The condition of the nervous system also affects the transformation of the glycogenic matter. When the spinal cord is cut or wounded near the neck, below the origin of the phrenic nerves, the activity of the hepatic circulation is diminished, and after four or five hours there is no trace of sugar in the liver, though glycogenic matter is found there. On wounding the cerebro-spinal axis near the fourth ventricle, the phenomena produced are precisely the reverse; the abdominal circulation is accelerated, and the glycogenic matter is so largely transformed that it appears in the urine. The paper closes by comparing the liver to a seed; first, a vital action stores up starch in it; then a chemical one changes this starch into sugar."

Subsequent experiments confirmed these conclusions, and established two points; first, that the formation of sugar in the liver was entirely independent of any external supply of dextrine or sugar; and second, that it is necessary that the animal economy should be in full vigor, in order that it be so formed. The livers of hospital patients, and of sick horses, were found to contain no sugar;—those of executed criminals and of healthy animals, were necessary for the experiments in which it was detected. The formation of starch in the flesh-eating animals is from food entirely free from carbohydrates, and on the other hand in the herbivora from food rich in those substances; while it ceases to take place in a diseased individual of either class.

In 1858 Dr. Pavy asserted, upon the strength of more than sixty observations, that the change into sugar was a *post-mortem* change; and that "the condition of the blood after death could not be taken as an indication of its state in life." He found that the injection of potassic hydrate into the liver, instantly after death, prevented the formation of sugar. The subjection of the liver to a low temperature by instantly throwing it into a freezing mixture, had the same effect. Dr. Pavy objects to the name "glycogenic matter," of Bernard, as incorrect; and proposes "hepatine" instead. He found that if a sufficient quantity of this substance is artificially injected into the blood, the urine becomes diabetic.

In 1859 Berthelot and De Luca determined by experimental research the nature of the sugar produced by the transformation of this substance. They found it to be identical with the ordinary glucose of grapes and the sugar of diabetes.

BINOCULAR VISION.—Professor Le Conte, of South Carolina, in an article in *Silliman's Journal* for January, upon the above named subject, describes in detail certain interesting experiments, from which he concludes that, contrary to the heretofore universally accepted doctrine among physiologists, the axial and focal adjustments of the eye *can* be dissociated at will, and that with perfect ease, after suitable practice. He succeeded in so educating his own eyes that he could bring out successively four distinct images of a figure upon the carpet, one above the other and in perfect proportion to each other, according to the distance. The nearest of the four images was but seven inches from his eyes.

Professor Le Conte thinks that upon this principle of "disassociation of consensual adjustments" may be explained the fact that many persons experience difficulty in seeing stereoscopic pictures distinctly, even when the two pictures are brought into perfect coincidence. He says: "We judge of distance, as is well known, by the axial adjustment. If then the two pictures are so taken that, in order to bring them together, the visual lines must meet at a certain distance, say fifty yards, then the picture will be seen at that distance, and of course very much enlarged. But in order to see the picture clearly, the rays must come to the eye as if they diverged from the same distance; for the eyes are adjusted for that distance. To fulfil this condition lenses are always used; but it is obvious that a given pair of lenses are suitable for one distance only. For all other distances, or degrees of optic convergence, there must be some degree of dissociation of the two adjustments, and this is both difficult and fatiguing to most persons."

WHAT THE NINETEENTH CENTURY IS TO BRING FORTH IN SCIENCE.—The following passage is from the opening address of Dr. J. A. Meigs at the commencement of the session for the year at the Jefferson Medical School: "The great advance of our knowledge in histological and morphological development since the beginning of the present century, coupled with the new doctrine of the forces, has given rise to the growing conviction in the minds of physiologists that we are upon the eve of some great discovery in Biology, which will prove, in the hands of future physiologists, as powerful a means of research as has already been in those of the chemist, the law announced by Kirchoff in 1859, relative to spectral analysis. It may be that this discovery is to be reserved as the crowning glory of the coming century."

THE ECHINODERMS.—A Viviparous Echinoid from the Chinese seas, is described by Dr. Edward Gruhe. This completes the parallel,—says the London *Quarterly Journal of Science*,—between the Echinoderms and the worms:

"We now know, in both groups, of animals laying eggs which produce embryos developing directly into the adult form; of others which present strange larval conditions which either become completely altered, so as to form the adults, or bud off from their interiors a small mass of living tissue which becomes the adult, leaving the larva to perish. We know, in both groups, of hermaphrodites and of dioecious species, and now we have added a viviparous form of Echinoderm, such as was previously observed in some Nemertian worms. We have yet to discover among the Echinoderms the various modifications of asexual reproduction, by pseudova, fissiou, or true partheuogenesis."

THE CALORIFIC SPECTRUM.—M. Desains finds that the delicate bands of the spectrum, having the same refrangibility, but proceeding from different sources, are unequally absorbed by the same medium.

SPECTRUM OF THE AUGUST METEORS.—Mr. A. S. Herschel says the spectrum of the August meteors was like that of a spirit lamp flame supplied with moistened salt.

White Pine Summary.

During the week the prevailing sentiment with regard to White Pine has been less excited than in the week preceding, the tendency being to accept White Pine, its excitements, and the important attending and resulting developments of the interior, as a fact of the times which must of necessity be got used to, as we get used to war, small pox, or any other great or small event that may, or can happen.

THE WEATHER.

The weather after the 13th inst. became stormy again, and the four or five thousand people who left this State during the mild three weeks preceding that date, undoubtedly found occasion to appreciate the quality of their California blankets. Once more frozen feet, fingers, noses and ears have became the order of the day. The streets of Treasure City, previously dry except behind houses, are again clothed in white, the winds bluster, the prospectors shoulder their tools and return to the ravines, cabins and fires, or to the shades of the hurdy gurdy. "I think," say the wise ones while it snows and blows, "that we shall see some severe weather yet." For five days the silver pilgrims were cooped up to their own excitement-breeding company, enveloped in the Pogonip; and many letter writers confess somewhat dolefully that matters appeared dull, an anxious feeling of relapse probably from a consciously artificial excitement. On the road to White Pine, from the east especially, there has been much suffering. Something of the character of the experiences detailed in our exchanges may be obtained from Charlie Manley's letter from "Hole in the Rock," Idaho, copied in the Montana *Post* of March 5th: He says:

"The worthy Superintendent for Wells, Fargo & Co., Mr. Taylor, passed here yesterday. He suffered dreadfully from Pleasant Valley, holding the buffalo robes over a lady and little girl who would have frozen to death only for him. I do not think he could have stood it half an hour longer. He froze one foot and suffered more than I would for Wells-Fargo's whole outfit. We would have had it rough enough but for his kindness in letting us have wood here. We noticed a man half a mile from here last night leading his horse, and saw by the way he traveled all was not right. So one of the boys and myself went to him. When we reached the spot he could not speak. We throwed him around miscellaneously and got him to the station as quickly as possible. His hands and feet were both frozen. He was insensible with cold, but we kept his hands and feet in water a half hour when he came to. He says his game would have been up, but for us, as he could never have made the station alone."

CONTRADICTORY ACCOUNTS.

From Tressure City the weather reports appear to accord with the feelings of the writers. "P," in the *Herald*, writes that it is not colder than at Virginia City, and that the country is a splendid one to "make a raise" in. The *Bulletin* correspondent of the 17th says just then it was fearfully cold, and speaks of hail driving, sleet falling at intervals, the streets being a bed of slush knee deep, the snow four to ten feet deep in the mountians; so that prospecting would not be possible before May, and in some localities not before June. He predicts two months more of extremely stormy weather, and says he has spent ten years beyond the Sierra, and three winters in that region. These facts, however, apply only to those who do not own, or expect speedily to own any chloride pockets. "P," above refered to, could distinctly see the stars through the rifts of the Pogonip. A similar discrepancy exists on the subject of pneumonia and small-pox. "Chloride," of the *Enterprise*, says pneumonia is a bugbear; is rare, and where it exists does so more in imagination than in reality; the unusual mildness of the winter at White Pine being the cause! Small-pox, according to "Chloride," has not got up the hill yet. The *Bulletin* correspondent, on the other band, sees coffins carried through the streets every day, and says the report is that the unfortunate pilgrims died of small-pox; while pneumonia, he says, is common, and is generally fatal. Sickness, he thinks, will prevail to a considerable extent for several months, until the exposure resulting from bad housing will cease.

RATHER COMPREHENSIVE.

"P" says: "No mining district ever discovered has created the attention which this has received. I am shown letters daily from all parts of the globe anxiously enquiring about the condition and the future prospects of White Pine." He expresses himself relieved to think that the peculiarities of the mineral deposits of Treasure Hill will discomfit that unmitigated class of humbugs, or worse, known as mining experts, and as a lover of genuine science rejoices.

ROAD TO WHITE PINE.

The White Pine *News*, of the 13th, says the road from Elko was in an excellent condition, teams going over it heavily laden, and experiencing no difficulty, the present traveled road being by Denver's toll road, which crosses a low range of hills bordering the valley of the Humholdt, and after about 15 miles enters Huntington valley at Shepherd's station, following the same due southward 100 miles to a cañon in the White Pine mountains, whence the road continues at a rapid rise for eight miles to Treasure City. Generally the road keeps at the foot of the Diamond range of mountains, which forms the western boundary of the valley. Although this is a mountainous country the mountains are so broken and cut by great chasms that easy passes are found leading east and west, while the great valleys running north and south offer unexampled facilities for the construction of roads of the very best character.

The *Bulletin* correspondent of the 18th, however, says, of the Elko road, that it is now very bad in places, and will be almost impassable in a short time, with very little prospect of its improving for the next two months. The stages, which a week ago came through in less than 20 hours, and latterly in 24 hours, now take 34, and will soon require 40 hours, and perhaps more, to get through.

At Virginia, and other places beyond the Sierra, pack and saddle animals are being advertised for sale.

The *Reveille*, of the 19th, is informed that the eastward bound train went on from Argenta with "about 200 enterprising souls from California," and that "there were thirty petticoats in the number."

THE PROSPECTS.

The *Enterprise* of the 20th states that a few persons are still leaving almost daily for White Pine, but there is no particular excitement in regard to that country at present. Most persons say that it is now too late to go out there to locate mines and town lots, and if the mines are all right, and prove permanent, it will be as well to go six months hence as to rush out there at the present time.

The correspondent of that paper on the same date writes that miners are in great demand, and any number would be able to get employment at $5 a day, the demand increasing in proportion to the number of mills that are being put up. But the trouble was that all who knew how to set off a blast were off prospecting for themselves, and could not be had. One fortunate possessor of this desirable knowledge at White Pine was working the night shift by preference, in order to have a chance to prospect during the day. On the same subject the Grass Valley *Union* of the 20th publishes an extract from a letter from White Pine, in which the writer says: "My advice to all in Grass Valley is to remain there, as it costs considerable to live here, and for workingmen there is very little to do; and unless they have cabins to live in, it will cost them every cent they receive to live." "M," writing to the Amador *Ledger*, says miners and carpenters will do well. As all who go to White Pine will be either miners or carpenters to the extent required there,—after taking a few lessons from "P," perhaps,—there is hope that the gloomy and rosy correspondents will yet, in some way, strike an average on the prospects, without the necessity of coming to any unhappy catastrophe.

LESS BRILLIANT VIEWS.

Amongst our clippings, those giving gloomy colorings to White Pine this week, outnumber every other subdivision of the subject. Part of this is owing undoubtedly to the late storms in Nevada, and part to a jealousy of the new field, from the injury it does in drawing off labor and capital from other first-class mining districts. But mining on this coast is like sea-faring, a roving life; and the adventurers are on the move to and fro constantly, between centers that command the power to attract them. The general opinion is gaining ground that the number of rich mines at White Pine is limited. It would be strange indeed, if the wild fancies of excited locators should all be realized, since silver does not concentrate itself naturally in the way that gold does, in convenient surface deposits; and though the metal actually exists pretty plentifully almost everywhere, the circumstance of its being mineralized and "rebellious" renders it to a greater extent unavailable where found.

A correspondent quoted in the Idaho *Tidal Wave*, of March 9th—Louis Gazelle—writes thus to a friend in Silver City, I. T.: "To come right down to the facts, Tom, this thing is not what it is cracked up to be, mind what I say, and I have taken pains to find out for myself. It is true, if a man is on the rustle he can make money here. Anything in the shape of a location will sell for cash down; money is plenty here, but my advice to the boys is to stay where they are; there is no use talking, there is more wild-cat business done here than I ever saw in all my life. Peter and I are rushing around locating, and Jim and George are working for wages to keep us in grub, for to tell you the truth, of the of the $2,000 we brought here a month ago, there is not a cent in the whole family. We think we have some good locations, and will pitch in next week to open them up."

The *Enterprise*, of the 18th, also gives an item which is "Not so Fine." It mentions that a private letter received in that city from White Pine a day or two since, says that unless something more is found than is now known of, crowds of men will be walking barefoot out of that region next fall. The writer says that even now he sees two or three hundred men daily looking in vain for work.

A correspondent of the Amador *Ledger* says a building lot costs from one to eight thousand dollars; mechanics get $8 and laborers $5 per day. "I am paying $4 per day for my living; there is very little building material, consequently but little work to be done. From my view of the matter I think I have come here about five months too late to make a strike."

The Nevada *Transcript*, of the 18th, says: "The truth is, White Pine is already running over with people, and every man who goes there with great expectations of wealth, soon begins to ask why he sees so little work done, and parties of ten and a dozen leaving for other points every day. "Why don't the people stay and dig, if there is so much silver?" The only answer a White Piner can give is, "The Eberhardt is very rich," and this is the sum and substance of all there is of White Pine."

A large amount of space is devoted by correspondents to town lots—about as much as to the actual mining memoranda. One of the most enterprising new towns, on paper, is Pocotillo, a map of which we observe has been posted on the walls and fences in and around San Francisco within a day or two.

THE MINES.

Mazeppa Flat is another of the newly discovered flats reported to be rich. It is far down on the southern slope of Treasure Hill, more than a mile below the Eberhardt. In the Carolina mine, situated there, a twelfth interest is reported just sold to a San Franciscan for $25,000. The Orphan Boy, Comstock and Thunderbolt are hard by, the latter being traceable on the surface for 60 yards, it is said, the surface ore assaying $500 to $2,000.

A great Union Tunneling and Mining enterprise, says the White Pine *News* of the 13th, is on foot, the object of which is to get an inside view of Treasure Hill. The line as laid out is through the entire mountain, near the Hidden Treasure mine, beginning on the east side. "We understand," says the *News*, "that some of the heaviest capitalists of San Francisco have taken hold of the matter, and that they propose showing us what the inside of Treasure Hill is made of. They will hold all isolated deposits of ore found in their area, and three thousand feet in length on all blind ledges discovered by them."

"A Miner" writes deprecatingly of the presumption of those companies which propose to tunnel through Treasure Hill, and claim several thousand feet on every blind ledge they strike. Such a claim, he thinks would take in the property of other people who are sinking on "indications," but have as yet struck no pay ore. He asks which would have the best right to the mines struck, the tunnel or the shaft party; and the *News* replies that the one first striking a ledge, or body of ore, would be the owner.

Babylon is the name of a city once famous, whose name is now of the past.

NEW DISCOVERIES.

The principal characteristic of a mining excitement is that there is a happily refreshing number of "rich strikes." They are heard of a hundred times a day. How insignificant these become after a year's test of time, the deserted mining districts can attest; yet the assays are always entitled to respect. * * A quantity of ore from a newly discovered mine called the Angel ledge, near the Hamilton and Shermantown road, assays $746.32. It is in a locality where no metalliferous veins have heretofore been found. * * Good reports are brought from the Red Jacket and Alexanderine mines. The first is located near the Eberhardt, and is about thirty feet in width. Late developments indicate a mine of great value. The Alexanderine is on the east side of Treasure Hill, near the Pocotillo. * * The California, on Sunnyside Slope, below the Eberhardt, has made big strikes of unexpectedly rich ore. This is owned by the Stanford brothers, having been bought by them about six weeks ago for $50,000. They have stripped the ledge about 400 feet in length westerly from their notice, up to the west extension, and find the walls perfect and the ore very rich. * * The Highland Chief lies a short distance above the Aurora, and the vein runs parallel with it, the course being northwest and southeast. A large opening in the mine shows a width of ledge of about nine feet. Six tons of Chloride ore were lately reduced at the mill, producing $100 per ton. * * Among the discoveries lately made by the prospectors hunting for the Eberhardt extension, is a fine appearing ledge called the Golero. This is a few hundred feet northeast of the workings of the Eberhardt. The present developments show a beautiful and well-defined ledge of spar, carrying but little metal. * * "In an excursion, (says the editor of the *News*, March 20th,) around the southeastern base of Treasure Hill, and down the ravine below the Eberhardt, we were surprised at seeing the number of people sinking shafts, running tunnels and otherwise reaching for the extension of that great vein or mine. One, called the French Co., of which, we understand, Pascal, Duhedat, Bourgoing and other capitalists of San Francisco are leading members, is pushing work with considerable energy." * * Half a dozen cases are reported of fresh strikes on Chloride Flat, which are not especially worth noting, except that in the Canton shaft where a good body of ore has been struck at a depth of 116 feet. This shaft passed through the first stratum of ore at a shallow depth, but the owners, not being satisfied with the prospect, pushed on down and are now working in a mass of chlorides of the finest grade. We are not advised as to the dip and strike of this deposit, if it has any,—whether it is conformable with the limestone, or a mere bunch or pocket inform. * * The greater part of the work done recently, says "Chloride," aside from prospecting, consists in "tracing" the veins so as to be ready for "injunctions" as soon as the Court is established. "The Great Bear of Chloride Flat," as the Bank of California is called, is expected to make things particularly lively. There are a thousand and one locations on Chloride Flat, in a space but little larger than a 40-acre lot. But the claims call for from 800 to 1,000 feet each on the ledges, with all "dips, spurs, angles, offshoots, outcrops, depths, widths, variations, and all the minerals and other valuables therein contained." So says the law, and the oldest location wins. The Bank has bought up nearly all the old titles, and now proposes to "go for them."

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

San Francisco, March 27, 1869.

City Stocks.

In miscellaneous securities there was very little done during the past week in the open market; however, private transactions in legal tender notes and Government bonds have been very considerable. We note a small sale of Spring Valley Water Co. stock at $67 50 per share.

The returns of our local insurance companies to the Internal Revenue Department, for the months of January and February, have been as follows, upon a currency basis of 74 cents on the dollar for the month of January, and 77½ cents for February:

Companies.	January.	February.
Pacific	$81,811	$85,910
Union	42,109	32,956
Fireman's Fund	22 868	20,238
California	9,078	11,726
Merchants' Mutual	24,089	16,568
Occidental	12,532	17,634
Home Mutual	13,733	13,648
People's	17,130	11,340
Total	$224,351	$208 242
Same time in 1868	158,573	173,183
Increase	$63,778	$36,059

The receipts of the city railroads for the months of January and February were as follows:

Companies.	January.	February.
Omnibus	$2,716	$2,241
North Beach & Mission	20,909	19,999
Central	13,974	13,493
Front Street, Mission & Ocean	7,849	7,732
Market Street	9,886	9,497
Folrero & Bay View	2,039	2,121
Total	$76,813	$73,001
Same time in 1868	67,039	69,038
Increase	$9,774	$3,963

Mining Share Market.

There has been a slight improvement in mining stocks during the past week, imparting considerable activity to the market. The short interest continues to attract the attention of some dealers, and sellers' option contracts are made with more freedom, giving strength to the market upon the prospective demand for stock for future delivery. Favorable reports are at hand regarding the developments in several of the Comstock claims, which we have every reason to believe will continue. Other companies are vigorously driving drifts with great confidence as to favorable results within a brief period.

The interest taken in the White Pine mines is increasing from day to day, and the present fine weather has started many in that direction, who intended to remain here some time longer. The incorporation of companies is also on the increase, not a day passing without the entering of a number of certificates. In the Board the transactions of this class of stocks during the past week embraced Aurora Consolidated, Featherstone, Pocotillo, Brodt and Virginia.

Amador (Cal.)—sold at $277 50@290. This mine continues to look remarkably well. The bullion returns for the current month are expected to exceed $60,000....

Chollar-Potosi improved from $162 to $173 50, and closed at $173. During the week ending March 19th, 600 tons of ore were extracted, against 844 the previous week. The various developments in this mine have not yet taken a favorable turn. On the 23d inst. the shipment to custom mills amounted to 80½ tons of ore.

Crown Point—ruled at $72@75, and closed at $72. The receipts of bullion to date for March account foot up $16,800....Gould & Curry sold within a range of $106@115, and at the close realized $111. On the 22d instant, they commenced sinking on the solid quartz in the shaft, which appeared as promising as that found before work was suspended, but unfortunately the machinery broke on the following day, requiring a stoppage of from three to four days....Hale & Norcross improved from $89 to $94, and at the close sold at $93 50. The bullion receipts to date for March account reach $34,600. At present the future prospects of this company are quite favorable.

Imperial—advanced from $85 to $93, and closed at $94. The accumulation of water in the shaft, reaching to the 1,000 level, at present prevents further developments in the lower levels; however, this will be speedily removed. The shipments of bullion to the 21st instant, aggregate $10,717 85 against $16,256 27 same time in February....Kentuck improved to $270, declined to $259, and closed at $258. To the 24th, the bullion returns for the current month foot up $37,664.

Ophir—sold quite largely at $20@32 50, closing at $32. The new hoisting works "are situated south of the Sierra Nevada, and about 150 feet east of the supposed east vein developed in the Savage and Hale & Norcross. The shaft is 700 feet in depth, from which a drift is now being driven west, which was in 111 feet on the 24th—all the way in hard rock, requiring, so far, no timbering. The rock is improving, and working to better advantage. It is expected that the east vein will be struck in fifty feet further; the west lode, upon which the old works of the company, now closed, are situated, being distant something over 600 feet. At present no water of consequence is met with in the shaft. The company have on hand a large supply of wood, timber and other materials. They are said to be free from debt, and the Superintendent is pushing forward the work of development with great energy and economy."

Occidental—sold to a large extent during the past week, improving from $27 to $31, and at the close realizing $28. From a letter to the *Daily Herald* we extract the following in regard to this mine: The Occidental is situated about three miles from Virginia, on the northeast side of the Leet & Birdsall toll road to Dayton. It was originally taken up in 1860 for lime; the character of the surface rock fitting it for that purpose. The amount of silver contained was so small that it could not be profitably worked for that metal in those days of high prices, although several parties during the succeeding five years attempted it at various times. Finally, in July, 1865, the mine passed into the possession of Messrs. Weston & Slanck, who, having a mill of their own eligibly situated, were enabled to work the rock with a small profit. Since then the quality of the ore has steadily improved, as depth was attained, and the bullion shipment has risen to about $40,000 monthly; $9,000 was shipped during the past week. Under the management of these gentlemen, about 40,000 tons of ore have been worked, yielding over $700,000; the rock averaging from $16 to $18 per ton, and paying a profit of from $5 to $7. At present but eighty tons per day are being shipped to the mill, owing to the wretched condition of the roads, which renders hauling almost an impossibility. It is intended, as soon as the weather admits, to commence the construction of a mill at the mouth of the lower tunnel, to contain forty stamps, or more, if required, with a daily crushing capacity of 100 tons. The mill will cost $80,000. When completed, the immense bodies of low grade ore which the mine contains can be extracted and reduced at a cost which will leave a net profit of from $3 to $5 per ton. This mine is located upon the same lode as the claims in Flowery District; the croppings being plainly traceable for its entire length of 1,800 feet, and through the adjoining claims on the north. No assessment has ever been levied; the rock paying from the surface down. By the workings at present, a body of ore of uniform quality, milling from $15 to $18, averaging ten feet in width, is exposed for 600 feet in length and 400 feet in depth; equivalent to 120,000 tons. Of this, 40,000 to 50,000 tons have been worked, leaving on hand about 75,000 tons. The quantity of low grade ore in sight, which will mill from $9 to $12, and can be worked at a profit when the new mill is erected, is fully as great. Should the lode continue of the same width and quality to the depth of the lower tunnel, a distance of 300 feet from the bottom of the first winze, the company will have sufficient ore for a number of years.

Sierra Nevada—exhibits marked improvement in price, advancing from $35 to $47, and at the close selling at $46. We quote again: The rock at present being worked is obtained from the southeastern slope of Cedar Hill, the excavation commencing about 150 feet above the mill, and being now breasted out 300 feet in length by 40 feet in width, and from 20 to 40 feet in height. In the northern portion of the breast no indication of a wall is shown, but the whole mass presents every appearance of a yield equally good with that now being worked. A drift has been run in on that side twenty feet, all the way in the same material. The extent of the pay on the north side is unknown. The south side of the breast, at several points, shows indications of a wall, or hed rock. They are now taking from the bottom of this excavation about four feet in depth of quartz gravel, which prospects and pays much better than that taken from above. It is not yet known to what depth it will continue. All the ore taken from the excavation is dumped into chutes which deliver it at a tunnel running below the road, whence it is taken in cars to the mill, a distance of about 120 feet. Westerly from this breast, a distance of 300 feet, there is another excavation made at a depth of 30 or 40 feet, which develops the same character of gravel and quartz, that prospects equally as well as that now being worked. From all appearances this will in future be one of the paying mines of Storey county. About twenty men are at present employed in the mill and at the mine. The mill contains twenty stamps, crushing from 40 to 50 tons per day. Under the present efficient management, the rock, being sorted and worked to better advantage, yields much larger returns than formerly, and the fortunate stockholders need not be surprised to learn that the product for the present month, although a stormy one, is treble the amount of that for any other since the mill has been put in operation. All the water used in the mill is pumped from the shaft. The ore is worked for gold alone, being amalgamated in the batteries and run over copper plates. The tailings are run through blanket sluices a distance of from 800 to 1,000 feet. The total cost of running and working is from $3 to $4 per ton, and the yield is from $12 to $15—leaving a very handsome profit. This only refers to the quartz gravel, which is shoveled in as it comes, the sorted coarse rock netting a much larger amount—probably from $40 to $60.

Golden Chariot (Idaho)—was in the market at $50@61. From Prof. Ashburner's report of this mine, we learn that the yield for the month of December, 1868, was at the rate of $190 74 per ton, and in January, 1869, $154 08. It is stated that about $1,000,000 in bullion has been extracted since the autumn of 1867. The monthly product of ore at present varies from 300 to 325 tons, and the total expense, including mining, milling, transportation of ore from the mine to the mill—a distance of 2¾ miles—and all dead work, are from $15,500 to $17,000 monthly. It is stated that there are in sight, and thoroughly developed, about 1,200 tons of ore between the first and second levels, which it appears safe to assume will yield an average of $150 per ton, or $180,000; that between the second and third levels the vein is developed on two sides, and partially on a third, and that so far as explored there appears every indication that this portion of the mine will furnish at least 4,000 tons of ore, the average value of which there is now no reason to suppose will prove less than that taken from above.

Bullion levied an assessment of $10 per share on the 20th, Julia $2 50 per share on the 19th, and Overman $20 per share on the 20th inst.

The Poet Longfellow's Mistake.—The author of Evangeline relates in excellent meter that on a certain evening an enterprising youth was observed climbing a mountain (probably one of the Sierra Nevada range), bearing in his hand something which had the appearance of a banner, inscribed with the word "Excelsior." As "the shades of night were falling fast," and the weather was somewhat misty, it was, of course, easy enough for the spectator to be mistaken as to the character of the article borne by the traveler, and the nature of the inscription. There is now sufficient reason to believe that this was the case; for at the time when this individual was seen, a corps of active young fellows, numbering in all some two hundred, were engaged in planting in the most elevated and conspicuous positions all over the country, signs or tablets bearing on their face the letters and figures, "S. T. 1860—X," the mysterious equivalent of "Plantation Bitters." *

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Name, Location, Amount, and Date of Assessment.	Day Delinquent.	Day of Sale
Alpha Cons., Storey co., Nev., div. $2	Pay. June 19, 1868	
Amador Co., div. $6 per share	Payable March 10, 1869	
Arimdon, Nevada, March 17, $2	April 20—May 3	
Bacon, Storey co., Nev., div.	Payable June 19, 1868	
Belcher, Storey co., Nev., March 15, $5	April 17—May 3	
Bullion, Storey co., Nev., March 20,..	Payable immediately	
Chollar Potosi, div., $25	Payable Oct. 15, 1867	
Crown Point, dividend, $7 50	Payable Sept. 12 1868	
Chloride Mt. Tun., White Pine, Feb. 2, 50c	Mar 13—Ap. 10*	
Conway, Preferred Stock, div. 1½ per cent	March 16, 1868	
Cherokee Flat, Butte co, March 1, $5	April 3—April 20	
Cordillera, Mex., March 16, $1	April 20—May 10*	
Daney, Lynn co, Nev., March 8, $2.50	April 12—May 3	
Douglas, White Pine	Annual Meeting April 12	
Empire M. & M., Nev., dividend $6	Payable May 15, 1867	
Eureka, div. $5	Payable March 10, 1869	
El Tasie, Sonora, March 22, 50c	April 23—May 17

Aeration of Water.—An interesting fact showing the importance of a thorough aëration of drinking water, has recently been observed in connection with the Fairmount water supply of Philadelphia. Some miles above the point on the Schuykill at which the water for the city's supply is taken out, there are several manufactories, from which refuse matter is drained into the river. For some distance below these manufactories the water of the river is quite dark, from the presence of organic substances; but as it approaches the city, it becomes manifestly clearer. This change has been attributed to an increased absorption of oxygen from the atmosphere, below the points of adulteration, by which the impurities are supposed to be more readily deposited in the form of mud. A reason for this assumption is found in the fact that when the river is covered with ice, as it sometimes is in winter, the impurities are carried quite down to the point where the city's water supply is taken out. So manifest is this latter fact, that at such times numerous complaints are made with regard to the impurities of the water.

Mining and Scientific Press.—This useful and scientific journal has entered upon its eighteenth volume.

To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

Save your eyesight by procuring a properly adjusted pair of spectacles. C. Muller, 205 Montgomery street, understands how to adapt them to the eyes of every one. *,*

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our Mining and Scientific Press printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. B. EWER.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

OUR interior exchanges are rejoicing over the late rains. Both miners and farmers feel that they are all right for the season, even if we should have no more rain. "Grain has taken a fresh start, and is growing rapidly." "The prospects of abundant harvests in this section are extremely flattering.' The dirt thrown up by miners during the dry season for future washing, may now be realized from;—mining ground is being worked that is only workable with free water;—and everything is lovely.

CALIFORNIA.

ALPINE COUNTY.

From the *Miner*, March 13th: Another run of 18 ft. was made in the Imperial tunnel last week.

The wheel at the M. C. mill is being set this week and the grading for the flume is nearly completed.

The last 13 shifts, working in the Alpine Tunnel, have added 15 ft. to the length thereof, and that too, all in the ledge. The character of the ore is improving day by day.

The Tarshish Superintendent will arrive here next week, when we may expect an early resumption of work.

The water is out of the Morning Star shaft and the work of drifting commenced. A disiuterested party tells us that the drift is already in the casing of the lode, and some ore is found all through it.

Silver Mountain *Chronicle*, March 13th: For the past few days the condition of affairs at the Pennsylvania claim has been the chief topic of conversation, and the prospect of soon striking the ledge has set some parties post-haste after non-resident stockholders, hoping to get their stock at a low figure. The tunnel is now in 920 feet, in easy working rock, and water is now coming in in great quantities. The distance from the mouth of the tunnel to the perpendicular of the croppings is 1,000 ft., and as the ledge evidently pitches toward the workmen it is very clear that the ledge will soon be reached. The mouth of the tunnel has been locked up and none but the Superintendent and workmen will be allowed to enter until after the ledge is struck and the stockholders notified. The Trustees are determined that those who have stood by the company shall reap their portion of the benefit that will accrue.

AMADOR COUNTY.

Dispatch, March 20th: The new shaft on the Coney & Bigelow lead, near town, has been sunk down to the depth of about 40 ft., and the work is progressing finely.

CALAVERAS COUNTY.

Chronicle, March 20th: One-half interest in the celebrated Petticoat mine at Railroad Flat, has recently been sold to Capt. Merryman, of Benicia, for $40,000. The terms of sale, as we are informed, are: $20,000 paid down, the balance to be forthcoming when the shaft is sunk 100 ft. deeper. Operations upon the mine will be pushed forward with energy. A new shaft in a more favorable position than the old one, has been commenced, and powerful machinery will be erected as soon as it can be obtained from San Francisco. Work is also progressing in the levels already run, the ore extracted yielding from $50 to $100 per ton.

Chapman, Hopper & Co., at Railroad Flat, have out nearly 100 tons of rock, that will average $60 per ton, which will be crushed as soon as Stuart's mill is completed. The rock previously taken from this mine, near the surface, paid $57 per ton, unassorted. The lead increases in width and richness as they go deeper. Sanderson, Gay & Co. have also a large quantity of rock out, and are constantly employed in sinking upon their claim. The ore prospects largely. The Balmoral and Chemisette are lying dormant. But very little work has been done upon them, although their appearance on top is favorable. Cudell & Co., and a number of others, are busy at work. Railroad will be the liveliest camp in the county this spring.

A letter from the above place says: Lewis & Co's claims, near Wet Gulch, is being carefully worked and is yielding exceedingly rich ore. They will commence crushing in a short time.

Twenty pounds of rock taken from the lead of Sanders & Co., Washington Ranch district, yielded $15.75.

EL DORADO COUNTY.

Placerville *Democrat*, March 20th: We have been informed by a correspondent at White Oak, in this county, that the Pyramid Quartz Mining Co. have been doing exceedingly well during the past winter. Also that Cooley, Smith and others, have discovered a very rich vein of quartz on Mormon Ravine. The lode is well-defined and about two ft. in width, and as far as prospected yielded about $100 to the ton. The indications are favorable of its becoming a paying claim, as the gold appears to be evenly diffused through the quartz.

LOS ANGELES COUNTY.

We learn from Mr. Messmer, who arrived on Sunday last from the Soledad mines, that the mill of Searles & Co. is now in running order. It carries five stamps at present, but has a capacity for twenty. It is running by water-power, having an abundance of water all the year. The parties invited their friends to partake of a collation and witness the starting of the mill, and a considerable number assembled. The mill worked beautifully, and will henceforth be kept going day and night—they having a large pile of rock on hand. The erection of this mill will give a new impetus to mining at Soledad, as large quantities of rock have been waiting to be crushed for months. Kabler & Co's mill has been running some time, and the ore pays well, and some parties are running arastras. A large number of people are flocking to these mines, and prospectors are finding new lodes every day. It is the intention of the Searles Co. to put on more stamps as soon as they can be procured.

NEVADA COUNTY.

Gazette, March 19th: Geo. F. Sharp has commenced suit against Sheriff Gentry, to compel the conveyance of the New York Hill Quartz Co's property, purchased by Sharp under execution.

E. F. Morse and others located on the 10th inst. 12 claims of 100 ft. each on the Higgins and Larrimer ledge, situated near the Larrimer mill on Wolfe Creek.

Letter from Anthony's Flat, March 16th: This community is highly encouraged with its quartz prospects. The Scandinavian has three arastras running. A contract has been let for the taking out of 500 tons of rock. The rock shows more free gold than any yet prospected. A good return is looked for when the clean-up is made. No Chinamen are employed.

Same of 20th: A crushing of 123 loads of quartz from the Lamarque ledge, on New York Hill, just made at the Sebastopol mill, yielded $2,197.

Transcript, March 28th: A company is putting up machinery for raising rocks and opening the lower end of Jones' Bar on the Yuba river.

The Mohawk and Montreal Co. are making good headway in running up the 400 foot level, and the rock shows an increase of rich sulphurets.

Same of 23d: The mining companies whose claims are located in the upper part of Nevada township, in the neighborhood of the Deer Creek Cascades have abundance of water and fine prospects. The Nevada Consolidated Co., Stranahan Superintendent, have two sets of mining claims at work, the Burrington Hill and Chalk Mountain claims. They are now working in the former with 400 inches of water and are making rapid progress in their 60-ft. hanks. Running through this claim, which has been thoroughly prospected by tunnels, they have seven channels or side washings from the main channel, all of them rich. In the Chalk Mountain claims they are running tunnels for the purpose of prospecting. The Red Diamond Co. are washing the gravel which they take out of the tunnel, and they have a fine prospect. Stephens & Co. commenced running yesterday. Houton & Co. have been washing all winter in the bed of Green Horn Creek and are doing well. The Enterprise Tunnel Co. have struck first rate gravel in their tunnel. The prospects in this locality were never so good, and as the late rains have given abundance of water, there is every prospect that large returns will be received during the summer and fall from these claims.

Grass Valley *National*, March 18th: Frank Morse cleaned up on Saturday $1,108, from a run of five days with eight stamps. This is exclusive of the sulphurets, which are both abundant and rich, and the rock crushed was the poorest which he had on hand.

Same of 19th: A. E. Davis, Michael Colbert and John Anderson arrived from San Francisco to-day. Mr. Colbert informs us that work will commence to-morrow at the Allison Ranch mine and the pumps will, in all probability, be raising water within a week's time.

Same of 20th: The certificate of incorporation of the Orleans Mining Co. was filed in the clerk's office yesterday. The company is formed for the purpose of locating, holding, purchasing, and working of mining claims and quartz lodes on Houston Hill, Ophir Hill and Osborn Hill.

Union, of 20th; Several of the old Grass Valley quartz miners arrived by stage yesterday. They mean business, of which the public will be apprized soon.

Between 40 and 50 passengers came through from Colfax yesterday. White Pine is not monopolizing all the travel.

Same of 23d: The incline shaft of the Allison Ranch mine is 480 ft. deep, and as soon as it is free of water, rock can be taken from the drifts and stopes. Little, if any work is expected to be required in repairs in the levels of the mine, as the ground is very firm. If no untoward circumstance occurs, the old mine, in a few weeks, will be again in full blast. The Wisconsin and Illinois mine has again started up. They expect to have the water all out of the shaft in 10 days, when work in the drifts will be immediately resumed. The Hartery mine, which has also been standing idle for some time, was leased to a company of practical miners a few weeks ago, and yesterday the mill started on rock from it.

Both the *Transcript* and the *Union* contain editorial articles setting forth the wildness of the rush to White Pine in spite of the warnings which are sounded; and try to show that, all things considered, there is no doubt that a man can do far better by going to Nevada County. It is by no means unlikely. The *Transcript* says: "In the older mining localities there are many claims which it would not pay to work years ago when wages and water cost double present rates, which can be worked now at a profit. There are also large ranges along the gravel channels which have never been prospected." The *Union* says: "During the coming season there will be more work offering in our mines than for years previously, and the labor of every miner here will not only be required, but there will be a demand for more."

PLACER COUNTY.

Auburn *Stars and Stripes*, March 18th: We learn of gold-bearing cement being struck in Thompson's Hill, just below the town, of almost fabulous richness, paying $200 or $300 to the pan. It has long been known that there was a large body of cement underlying the hill, which contained gold. From tests recently made there is no longer reason to doubt that the cement may be worked to great profit.

Herald, March 20th: We were shown yesterday a specimen of the cement recently struck in King Bro's claim, and also in the Baker Boy's claims, at Dutch Flat. The piece is about three inches long by one and a half wide, and three-quarters thick, and contains, imbedded in the bluish cement, coarse, bright washed gold, to the value of about $20. It is one of the richest and most beautiful specimens that we have ever seen. This cement was taken from about six feet above the bedrock, and will yield from $300 to $1,000 to the pan. The miners of Dutch Flat think they have actually tapped the celebrated "blue lead," and have vast sums within reach.

PLUMAS COUNTY.

Quincy *National*, March 13th: O'Neill & Leavit have discovered some rich ground in one of the branches of the old Betsy Gulch, near Elizabethtown, and are now at work on a ditch to bring water to the claim. Their prospects are good.

The Caledonia mill at Cherokee is running steadily, and is crushing good paying rock. Judkins & Kellogg have struck the ledge in their lower level,—seventy-five ft. deeper than their old works,—and are taking out paying rock. As usual, their mine is paying first rate. Stewart sold out half of the Stewart & White ledge, recently discovered, to Bachelder & Bellas, for $900. The purchasers have been offered a large advance on their purchase, but don't wish to sell. Cahalan has struck his ledge—the Bon-Accord—in his tunnel.

SIERRA COUNTY.

Downieville *Messenger*, March 20th: Good pay has at last been struck in the Union claim at Queen City. In five days' running last week, they took out 149 ozs., washing no stock dirt, but taking it as it came out of the claim. In the Monte Cristo, adjoining the Union, in nine days' running, 189½ ounces were taken out.

The Pioneer Co., of Grass Flat, has let a contract to Phillip Dory and John Jackman, to run 1,000 feet of tunnel, at $12 per foot.

SHASTA COUNTY.

Courier, March 20th: Moore & Co., of Portuguese Flat, have cleaned up $800 since the winter set in, and M. J. Hearst, whose claim is located on the same flat, has taken out a still larger amount. The balance of the miners on the flat are making fair wages. The Hazel Creek mines have paid better this winter than ever before. Andrews & Garet have struck good pay on Pitt Flat, and last week they took out seven pieces which they sold for $50. Clark & Miller have cleaned up over $1,200 during the last few months, and are still doing well. Nickols and others opened a claim on the head of this creek this season, and have made from $5 to $8 per day to the hand ever since they commenced work. Heretofore the mining has been confined to the bed of the creek, but experiments made this winter prove conclusively that the banks and bars will pay from the head of the stream to its mouth. There is paying ground here sufficient to furnish claims for 200 miners, and water is also abundant. Soda Creek has been almost abandoned this winter, but will be extensively worked next summer. It is almost impossible to work on that stream in the winter time.

SISKIYOU COUNTY.

Yreka *Union*, March 13th: Hon. John Dagget, who was in town a few days ago, informs us that the Black Bear Co. have been taking out and crushing more rock this winter than usual.

Scott Valley correspondence has this item: The Etna Mining Co. is running night and day, with every prospect of realizing a big yield. I was informed that there is not a dollar's worth of the companies stock to be had at any price.

TUOLUMNE COUNTY.

Sonora *Democrat*, March 20th: A little daughter of Mr. Jo. Aldridge, of Green Springs, one day last week, picked up near her father's house a piece of gold worth $20.

COLORADO.

Georgetown *Miner*, Feb. 11th: E. W. Rogers is actively developing the Junction lode, on Democrat Mountain. The shaft is now 45 feet in depth, carrying about a 3-ft. ore vein. The ore is quartz and mineral combined, some specimens being very rich, and the whole vein pays a nice profit above the expenses of mining and reduction.

The adit on the Mendota lode is now in 100 feet, the vein carrying from eight to fourteen inches of mineral. The surface ore carried scarcely any galena, and from $19 to $90 in silver. The ore they have been in for the last ten feet, carries 50 per cent. of galena and $548 in silver, to the ton of ore.

Same of 25th: Experienced judges estimate that there is now in sight in the Terrible and Equator lodes, not less than $2,000,000 worth of ore, that can be easily and economically drifted and stoped out.

Clark Hedge has discovered a fine lode on Sherman Mountain, about 500 feet below the Snowdrift. He has about five feet of quartz, carrying a goodly quantity of sulphurets.

Work on the crushing and dressing works is progressing favorably.

Huepeden & Co. have taken out and shipped, since our last report, silver bullion to the amount of $2,294.48, coin value. They are not running to their full capacity, as they cannot obtain a full supply of ore.

Stewart has shut down his works for the purpose of putting in three Blatchley pans. He will commence running again in about ten days, prepared to treat ores by raw amalgamation. He has just finished a lot of Snowdrift ore, that gave a yield of something over $100 per ton. The bullion was .910 fine.

Colorado *Herald*, Feb. 25th: Robert Teats has struck the biggest pocket of rich ore yet found in his mine. He took out eight tons of first-class ore yesterday. The streak is now over eighteen inches wide.

Mr. Fitzpatrick is running his stamp mill on ore from the Bates or Hunter lode, for John Sanderson. Mr. Sanderson has his shaft down to a depth of 240 feet, and at that depth has a very large vein of ore.

Neikirk & Virden commenced to sink on the Dead Broke this morning. For the past few weeks they have been moving wall rock. They are also running Walker's new 18-stamp mill, below Black Hawk, with good success.

Ten stamps of Brastow's mill in Lake Gulch are being run on Bobtail ore. There is not enough water to run the full capacity of the mill, which is a 30-stamper. Below Mr. Brastow, Mr. Cheney manages to keep his mill in motion on custom ore.

A very rich silver lode has lately been discovered on North Clear Creek, in what is known as the Bay State Mining District.

There are five companies at work drifting on North Clear Creek, above the mouth of Russell Gulch. The water, since the advent of the late spell of cold weather, is very scarce, there being scarcely a full sluice head. Alex. Cameron is making preparations to open his claims above the Junction, and will run two branch flumes. His main flume is to be 24x24 in the clear.

Boise City *Pioneer*, Feb. 17th: Dan. Sutphen is at work on the California lode, in Ward district. This lode has been in the cap for a long distance. This is now passed through, and Dan. reports a fine looking vein of ore, three feet wide.

Blake & Gleason's quartz mill, at South Boulder, is being removed and set up in Sugar Loaf district. It has eight stamps, and will be run by water-power, on custom ores.

T. J. Hill, of North Boulder, informs us that Samuel Conger and himself have discovered a fine silver-bearing lode—an ore of grey copper and black sulphurets. The ore seam is two feet wide and promises very richly.

Same of 24th: A fund of $40,000 has been secured, to be used in working the mine and mill of the Hoosier Co. Operations will be carried on briskly the coming season.

We have been shown some samples of ore from the Legal Tender lode, recently discovered by Mr. John Duncan. It looks the best of any surface ore we have seen in this country.

Some parties are mining and prospecting this winter at Gold Hill. We understand that a new gulch is to be worked.

Mr. Ramage, from Ward, says that snow is making surface mining rather tedious.

There is considerable excitement in Burlington over a discovery of gold. The new diggings are about one mile below the town, and are very favorably situated for working.

The Hoosier mill will soon be running to its fullest capacity, and this will be increased as soon as receipts will justify. The mine is in shape so as to produce any amount of ore.

Letter from Sugar Loaf, Feb. 16th: "Messrs. Blake & Shively have lately discovered a rich lode in Pennsylvania district. The name they have given it is the Viola. They will start work soon.

A few days since, John Duncan, an old prospector, struck his independent fortune by discovering a 3-foot vein of sulphurets of silver. He has given it the name of Legal Tender.

N. G. Snyder has made two rich discoveries on Sugar Loaf Mountain, the La Plata and Marietta.

Several parties talk of erecting reduction works on Four Mile."

IDAHO.

Owyhee *Avalanche*, March 13th: We are glad to be able to announce that the Rising Star mill is about to steam up again. Mr. Hall, the Superintendent, is vigorously making preparations for a long run. Mr. Cole's claims have been paid off and the attachment released. The hands have been paid. Mr. Frank Dougherty informs us that the mill is one of the best arranged he has ever seen, and the mine is looking exceeding well, the ore rich and abundant.

The Ida Elmore mill will start on the 20th. The New York mill is running on Poorman ore.

Total coin value of bullion assayed in Owyhee County during February, as returned by the Assistant Assessor of Internal Revenue, $68,098.05.

The Boise *Democrat* is informed that extensive preparations are being made for working the Willow Creek mines, as soon as the miners have water.

The Idaho City *World* of March 4th, says: Miners look hopefully for the working season to open in a few days. It promises to be a very profitable one.

Silver City *Tidal Wave*, March 16th: We learn from the *World* that the Elk Horn mine near Hog'em, has out about 400 tons of rock, and the mill will commence crushing in a week or two.

Thirteen bullion sacks, each containing a bar, aggregating a value of over $35,000 coin, were shipped for San Francisco on Friday morning.

Portland *Oregonian*, March 6th: We have received information from a reliable source, that a new mining district has been lately discovered—or rather, the knowledge of its discovery has just come to light—on Moose Creek, a tributary of the South Fork of Clearwater. A party of 10 or 12 men who made the discovery just at the setting in of winter, and who have remained there at work since, came down to Lewiston a few days since after provisions. They had with them several thousand dollars of the dust they had dug—very handsome and coarse gold. They represent the district as rich as the Florence district, and as extensive. It is about 180 or 200 miles from Lewiston.

MONTANA.

Helena *Post*, March 5th: The approaching mining season promises more favorably to all classes than that of last year. We now have 18 quartz mills of 280 stamps, running regularly, and yielding generally good profits. Many new mines have been opened in Deer Lodge, Jefferson and other counties, ditches have been brought into paying gulches and upon bars where water hitherto could not be had;—and several of the best, which could be worked last season but for a short time, will in all probability be favored.

Bohm & Co. assayed yesterday morning the last yield of retort from the Nowlan mill, at Cable City, forming a large brick, containing 520 ozs., which was valued at $11,870, currency.

Virginia City items: Capt. Guyer has purchased the mill and machinery of the New York & New Jersey Gold and Silver Mining Co. at Bannack, and several very valuable silver lodes of Mr. Stanton, situated in Brown's Gulch. It is the intention of Mr. Guyer to immediately erect in the vicinity a splendid first class mill, furnished with a full set of Bullard pans.

Seven bars of gold, aggregating 310 ozs., the current value of which was $10,000 in currency, was brought into Virginia City as being the result of about two weeks run on unselected rock from the Green Campbell lode... A project is on foot to organize a company to conduct the waters of the Madison river into Alder Gulch.

NEVADA.

REESE RIVER.

The Austin *Reveille* of March 16th., gives a full history and description of Rosevillo district, discovered and organized in 1866, but never much worked, although a 5-stamp mill, the Rutland, was put up and run for a time. The particular reason for the article becomes evident towards its close. We quote a few paragraphs:

"Latterly some attention has been turned to the mines of the district, by reason of the extraordinary developments in White Pine. The districts are similar. It was used to be objected to Reveille that its ore occured in limestone and would not be permanent. But White Pine has made limestone the fashion, and the objectors are silent. The splendid success of that district will prove 'sugar on the lime' of Reveille. We believe the mines of that district, with their rich ore, will command the attention of capital before the close of this year."

For the Southeast.—Early this morning six men, divided into two parties of three each, with capital outfits for a month's prospecting, left this city for exploration in the southeastern part of the State.

In its issue of the 17th, the same journal gives the history of Battle Mountain district, lately become important from the fact that the cars on the C. P. R. R. run within a few miles of its principal camp. From the "Little Giant" have been crushed tons of ore which averaged $300. The Reveille evidently does not believe that there is nothing else in the world but White Pine, in the way of mining ground; and he means to keep before the people the recollections of the wealth nearer home.

Nye County.—The Belmont *Champion*, March 13th, says: "It is currently reported that Alexander McKenzie has lately struck an extensive and rich deposit of ore in El Dorado Hill, at a depth of about 180 feet from the surface. The claim, which is owned by a Gold Hill Co., is situated on the same hill, and some distance north of W. F. Leon & Co's El Dorado South mine, and the character of the ore is precisely the same as in that famous mine. There is no doubt but that it is the same ledge."

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Territorial *Enterprise*, March 18th: The timbering of the shaft of the Gould & Curry will be completed within three days, when the work of sinking will be resumed. The cave did not break through the platform at the bottom, therefore there will be a certain amount of slum to remove from the sump. Some very promising ore had been struck in the bottom of the shaft at the time the cave occurred.

Occidental.—The water in the lower tunnel of this mine is increasing. A vein struck night before last was found to be almost milk warm. As yet the tunnel has cut no vein matter.

Sienna Nevada.—This company have made a good clean up for their last run of 15 days, and in the works are finding ore much richer than ever.

Justice and Independent.—The company are finding some very fine rock on their 160-foot level. Many specimens containing free gold have been taken out within a day or two. Ore of a promising character has also been found at the north end of the drift.

Imperial.—No developments of an encouraging nature have yet been made in the drifts from the bottom of the Imperial Empire shaft. The rock on the lower level is very hard.

Same of 21st:

Gould & Curry.—Owing to a slight accident to the machinery, the pumping engine was stopped for a few hours last night, when the water raised in the shaft to the hight of 10 feet. The necessary repairs have been made, and the water has again been reduced to its former level.

Sierra Nevada.—This company will shortly resume drifting on their lower level. The rock found on the surface continues to increase in richness as the work progresses to the westward.

Confederate.—The parties who are working the old Bajazetto and Golden Era ground through the Confederate shaft, on B street, are taking out some very good rock. The shaft is down 150 feet, from the level of which the old Bajazette shaft is used as a winze 50 feet deeper. From 60 to 70 tons of ore per day are being taken out.

Crown Point.—The company are engaged in repairing their shaft, which has been badly injured by the swelling of the clay and rock through which it passes. It will require some two weeks.

WHITE PINE.

[The latest items of news and information from this district will be found on another page.]

Railroad Items.

Stockton and Tulare Railroad.—The citizens of Stockton, after holding several public meetings with the view of devising some way of building this road according to the plan generally adopted in this State, —at the public expense,—finally hit upon the novel expedient of building it with their own money. At an informal gathering of a number of citizens, held on Saturday of last week, it was proposed to form a joint stock company, with a capital of $300,000, in 50 shares of $6,000 each; the said company to own and control the road entirely, asking no aid from either city or county, and locating the line where it will best suit the interests of Stockton and the valley south. The plan was first mooted about 9 o'clock, and in less than two hours, 25 shares, representing $150,000, or half of the required capital, were taken. The men who are leading in this movement are some of the most enterprising and substantial citizens of Stockton. In addition to the amount of capital stock, subscriptions will be asked of the people in both city and county, in such amounts as they may feel able to make. This plan looks feasible and business-like, and we trust will be earnestly pushed forward, until the whole of the large and fertile valley region to the south of Stockton is opened up to ready communication with that city, as the initial point and tide water terminus.

It is estimated that $300,000 will build the road to the banks of the Tuolumne river, and that it can be completed to that point the present season. The sum named is certainly most insignificant for the work to be performed; yet it is said to be sufficient. As soon as this initial section is completed, the investment will no doubt begin to pay, and will lead to the ready procurement of whatever additional amount may be needed to push forward the enterprise, southward from the Tuolumne, as fast as the growing business of that region will warrant. This road is one that is greatly needed, and we hope to see the work go on with as little delay as possible, and trust that we shall be afforded an early opportunity to state positively that the enterprise is beyond the possibility of delay or failure.

Stockton to Visalia.—It is said that Gov. Stanford and associates are engaged in surveying for a railroad route from Stockton to Visalia. If two roads were built, they would have to run nearly parallel and but a few miles apart, for nearly a hundred miles—in a southeasterly direction and along the easterly side of the San Joaquin valley. A main trunk to the neighborhood of Fresno, some eighty miles from Stockton, and west and east branches from that point to Visalia, and the west of the Tulare Lake, respectively, is what and all that is needed for the present to meet the growing wants of that region.

The San Pedro Railroad.—The bridge about three miles from Wilmington is completed, and track-laying renewed. The road is nearly all graded, and it is confidently predicted that the entire road will be finished and in running order by the Fourth of July.

The Vallejo Railroad.—The Marysville *Appeal* is informed that the Vallejo railroad will be completed to Yuba City by the first day of September next, and building of the Feather river bridge will be completed as soon as the road reaches that vicinity. The bridge is expected to cross the river a few rods above the present bridge.

The Feather River Road.—Work on this road, which is to connect Oroville with Virginia City, will be pushed vigorously as soon as commenced, which will be in a few days. In view of the early completion of this road the Butte *Record* calls on the Chicoites to take hold and build the California Northern Railroad on to their city, and thus place themselves in connection with a feasible railroad over the mountains, and with a line now being built from Vallejo and Marysville. The *Record* presses on them with considerable vigor the advantages they would thus secure to their section.

Warming the Hudson River.—A correspondent of the Brooklyn *Union*, who has been visiting Seneca lake—a body of water that never freezes over—makes the following astonishing suggestion: Considering that the immense volume of water of Seneca lake, in its high altitude, is kept from freezing by sub-aqueous springs, why cannot Hudson River, with its currents, its ocean tide, and salt water, its thousands of craft plying its surface, be kept from freezing by sinking artesian wells along the bottom of its channel? These wells, when once bored, never cost anything to run them. What millions of freight would be saved? This noblest of rivers would be no more ice-locked for a large portion of the year, rendering its lovely banks secluded and bleak; but from the bowels of mother earth a perennial warm fountain would flow, unlocking forever the present forbidden barriers, and enriching the State. There are moneyed interests along the river to expend a sum for the experiment. If, as in most other places, there can be the attainment of one warm stream from an artesian well in the bed of the river, the entire reclamation of the Hudson River for winter navigation is an assured success.

Gestation Among Fishes.—The modes of gestation among fishes is astonishingly various. Some are viviparous. In several species the eggs are carried about the outside of the body of one of the parents. In some the eggs are attached to the forward fins and under side of the head. Some are carried and hatched in a pouch precisely analagous to that of the kangaroo. In Guiana, during the breeding season, cat-fish are offered for sale with their mouths literally crammed with eggs and young in different stages of growth and development. Agassiz has recently observed in Brazil that many species of chiromoids carry their eggs at the back part of their mouth, and that some species of the loricarias carry their eggs attached to the broad membrane which surrounds their mouth.

Hardness of Silver.—Goldsmiths often complain of the hardness of silver, which is sometimes very difficult to carve, and presents a dead gray cut. These properties are generally attributed to the presence of a foreign metal; but M. Mathey, assayer at Locia, has shown that in this silver there is neither tin, lead, nor any other injurious metal. He considers this property to be due solely to the high temperature at which silver is cast. By letting the crucible cool till a slight solid crust is formed on the surface of the fused metal, and casting at this moment, a soft silver with a brilliant cut is obtained.—*Dingler's Journal.*

One Million.—The weight of one million of dollars in gold is within a few pounds of one and one-quarter tons, avoirdupois.

San Francisco:

Saturday Morning, March 27, 1869.

Notices to Correspondents.

MENDOZA, San Bernardino.—The planting of trees, no matter of what species, would undoubtedly tend to ameliorate the periodical dry season of your extensive inland county. Mr. Boressingault, in a wide experience in both Americas, and devotedly deep study of this interesting subject, asserts that extensive clearing of wood is followed by aridity, and when the reverse from accidental causes has occurred, the converse result has followed. In the first place, he contends that where extensive clearings are made, the annual rain-fall for such a district diminishes. In the second place, where the soil is deprived of umbrageous covering, evaporation goes on more vigorously; and lastly, when a great extent of land is dis-forested, and brought under arable cultivation in warm climates and the absence of moisture compensated by artificial irrigation, the latter greatly diminishes the amount of water flowing in the lower courses of rivers, and prevents the formation of lakes and similar natural compensating reservoirs, calculated to more equally regulate the flow of streams throughout all seasons of the year.

TAPIOCA, in chemical composition, does not vary much from rice, being chiefly composed of starch. This alimentary substance is derived from the *jatropha manihot*, a plant chiefly indigenous to the Brazils and Guiana. It contains, as expressed from the green root, one of the most active vegetable poisons known, being so deadly poisonous, that the natives employ it to poison their arrows. The juice, if allowed to stand after expression, the supermatant fluid is then decanted, and the crude precipitated tapioca is repeatedly washed with water until eventually the tapioca is rendered fit for use. A bread known as cassava bread, is also obtained from the same root.

FLORAL.—May-day celebrations are derived by us from our English forefathers; even the ascetic pilgrim fathers not being insensible to the beauties of the hawthorne and its customary accompanying charming weather. The English derived their practice from the Romans, and the Romans from the Greeks. A floral holiday betokens a poetical taste for nature and a mind free from griping and sordid cares.

FMELTER, San Francisco.—You put the matter on the proper basis, in inquiring as to the most economical way of smelting your ore. Without the aid of a competent smelter, however, you can do nothing. If your ores are pure enough, a Scotch hearth, or the Japanese contrivance, illustrated in the PRESS some time ago, would answer, and be more economical. Pure galena need not be crushed fine. The separation is by cupellation, in which the oxide of lead flows off.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Gold in China and Japan.

Mr. Pumpelly, in his recent Smithsonian publication, referred to in our issue of the 10th of October last, gives a table of localities of gold washings in the Chinese Empire, from which it appears that the gold regions there are quite extensive. Gold washings are found in fourteen out of the eighteen provinces of the Empire. Most of the localities furnish coarse placer gold, some of them quite large nuggets, and many are said to be very rich. The general working of these mines has been discontinued by order of the government, in accordance with some of their peculiar theories of finance. Unless the exhaustion of these placers has been greater than the imperfection of Chinese mining would lead us to suppose, there is much reason for believing that the gold regions of China are among the most extensive and richest which yet remain for scientific exploration. Gold in place undoubtedly exists there, although it does not appear from the papers before us that it has been discovered.

The existence of gold in Japan was known to the early Dutch traders in the East Indies, many of whom enriched themselves by purchasing and exporting the gold to Europe. The relative value between gold and silver was then, as more recently, much less than those in other parts of the world; hence a most favorable opportunity was presented for such traffic. The export of gold at one time reached an average of $2,500,000 annually, and nearly the same amount of silver found its way out of the country. This drain of the precious metals so alarmed the Japanese that important restrictions were placed upon their export. Good authority has estimated that fully $225,000,000 in gold and silver were exported from Japan during the seventeenth century.

During the early intercourse with that country gold was mostly exported in *kobangs*, a Japanese coin, worth in Europe $11 in silver; but which was valued in Japan at only $8.40. A still less disproportion between gold and silver existed at the time of Commodore Perry's visit to that country. At that time the relative difference was as one to three and one-seventh. To avoid the great drain which followed this discovery in connection with the reöpening of the Japanese ports, that government reduced the weight of its gold coin without changing its value, so that the relative values of gold and silver are now about the same in Japan as in other countries.

The first discovery of gold in Japan dates back to the year 708, previous to which time that people imported all their gold from China. The first recorded visit of a European to a Japanese gold-field was that of a Roman Catholic priest in 1620, a glowing and no doubt exaggerated account of which was sent to Europe.

The gold mines of Yesso, Northern Japan, were visited in 1862 by Mr. Pumpelly and Prof. W. P. Blake, of this State, acting as Commissioners for the Japanese Government. According to the publications of these gentlemen, the mines are government property, and are worked only on a limited scale. The works consist merely of washings, and yield but a small annual amount. The gold is found in the river beds and in the high terrace deposits on hill sides. Some of the placers have been worked over many times. (The Japanese method of washing for gold was illustrated in the PRESS of October 10th, 1868.) Trees were observed standing in some of the old workings which it was thought could not be less than 300 years old. To work these old placers, extensive ditches had been cut for many miles, exactly similar to those in use in this State. Ground sluicing is a method much employed there, aided by straw mats, upon which the concentrated gravel is drawn with a hoe. Up to the time of the visit of Messrs. Blake and Pumpelly, no board sluices, toms, or quicksilver appear to have been used; but these American adjuncts were subsequently introduced upon their suggestion.

The New York Elevated Railway.

The crowded thoroughfares of New York City have long urgently demanded additional conveniences for passenger transportation between the upper and lower portions of that city. Two plans, only, appear to be practical for the accomplishment of this end—either an underground or an elevated railway. The practicability of the latter will soon be thoroughly tested. A railway of this description has already been constructed from Cortland street to the Battery—a distance of about one-third of a mile. The road is supported on iron pillars, at an elevation of about twelve feet above the pavement—the inner rail being directly over the outer edge of the curb-stone.

Experimental trips were made upon this road on the 5th of February, in presence of the directors and a few invited guests. We were present at this trial and had the pleasure of a ride over the road. The cars are constructed very much like ordinary street cars, with front and rear platforms, where the conductor or brakeman controls the movement of the vehicle. The car is propelled by a series of endless wire ropes passing over pulleys, and kept in motion through the entire distance by a stationary engine placed underground, at the Cortland end of the route. At intervals of about 200 feet, along these ropes, and firmly attached to them, small upright iron standards are fixed, projecting upward three or four inches. When the brakeman wishes to start the car, he simply moves a lever and throws down a strong iron clamp which comes in contact with the first one of the aforesaid uprights which comes along, and by means of which the car is instantly set in motion and carried forward until it reaches the desired stopping place, when the brakeman has merely to reverse his lever, thus elevating the "clamp," so as to break the connection with the endless rope, and the car is brought to a standstill. The whole process and machinery is exceedingly simple and equally as safe as horse-power.

The car moves along very quickly, and with a steady, gliding motion, forming a most pleasant contrast with the ordinary travel upon a horse railroad, especially through crowded thoroughfares. We particularly observed that the horses below did not appear to take any notice, whatever, of the car. The road presents but little obstruction to the occupants of the buildings along whose front it passes. Most of the people in the street gazed with evident surprise at this new mode of travel, and evinced much curiosity to learn the secret of the locomotion.

The directors and invited guests expressed their fullest confidence in the apparent success of the enterprise, and were quite unanimous in pronouncing the Elevated Railway a practical success. We understood that it is the intention of the company to push the construction of the road out as far as Thirtieth street, as soon as possible, where it will connect with the Hudson River Railroad. Trains will be run each way every fifteen minutes. The rate of speed attained at this trial was about one mile in six minutes. If the anticipations of those who witnessed this same are realized, this mode of travel will soon become decidedly popular among the denizens of Gotham.

WE have received from the Montana Publishing Company a copy of the Montana Statistical Almanac, and Year Book of Facts, for 1869. It contains much valuable information, of which we shall avail ourselves hereafter.

REPORTED GOLD DISCOVERIES IN ALASKA. The schooner Ann Eliza, which arrived at this port on Tuesday last, from the Island of Kodiak, brings intelligence of valuable gold discoveries reported to have been made at three different points, wide apart, on the coast of Alaska. The first and most important, was on the banks of the Knyak river, which empties into Cook's Straits. The locality is near the seacoast, and in about latitude 62°, longitude 150°; the second was on the banks of the Chicut river, at a point about sixty miles above Sitka, and near the northern base of Mt. Fairweather; the third was on an island, the name and locality of which are not given. At the first named, according to the reports, one teaspoonful of gold dust was obtained from three shovelsful of gravel, taken six feet from the surface. The steward of the schooner exhibits specimens of fine dust, and several nuggets, said to have been obtained from the first locality. The discoveries were made by a Russian engineer, who was out on a prospecting expedition. There is nothing particularly improbable in the finding of gold in Alaska; but that country is too far off and too far north to make it a very desirable locality for mining operations. The season there would not admit of out-door work more than five months in the year. Moreover, much allowance should be made for exaggerated accounts of any discoveries which might be made there.

THE GENTLE SHOWERS OF SPRING still continue, at intervals, to scatter their refreshing bounties over the land, and our interior exchanges are profuse in their expressions of gratitude and joy at the prospects of the coming harvest. By some, the recent pluvial bounties are regarded even in the light of a special Providence, which has visited us just in season to avert calamity from our fields. Judging from the tone of the press, it is seldom that we witness a community more full of thankfulness and hope. With an abundance of water for agricultural and mining purposes, with the sure prospect of a most unprecedented emigration by the overland railroad, with an increase of railroad travel and traffic generally, with a great enlargement of coastwise and foreign commerce, and a corresponding increase in our manufacturing enterprises, to say nothing of the wonderful discoveries of new and rich mines, the proceeds from which are already pouring in upon us, there is no reason why California should not realize, during the coming season, a far greater and more general degree of prosperity than she has ever before enjoyed.

PROPORTION OF GOLD TO SILVER IN COMSTOCK ORES.—The State Mineralogist of Nevada in one of his reports publishes a table from which we collate the following figures, which probably show a very close approximation to the average amount in value, of gold and silver in the bullion from Comstock ores. The bullion taken from 5,162 tons of ore, from five of the principal mines, assayed with the following results;

Mine	Tons of ore crushed.	Proportionate value of Gold.	Silver.
Mexican	2,488	47.80	52.19
Savage	1,304	27.35	72.65
Potosi	133	25.84	74.16
Gould & Curry	440	24.63	75.37
Uncle Sam	827	32.12	67.88

The average value of the two metals in the ores above specified, is—gold 31.54, silver, 68.45; gold very nearly representing one-third and silver a little over two-thirds of the value of the bullion. This may doubtless be taken as a very fair statement of the proportionate value of gold and silver in the Comstock ores.

SUBTERRANEAN WATER-COURSES. — The celebrated French geologist, the Abbe Lombard, has lately discovered in the valley which separates Yvetol from Auzehose, France, a point where two sources of water cross each other at about thirty-five yards beneath the surface, which on boring have been found capable of furnishing nearly 300,000 gallons every twenty-four hours.

Concerning the Origin of the "Washoe Pan Process."

In our last week's issue our correspondent "J. S." stated that Captain Hatch was the man who blessed the country with the "Washoe pan process." "J. S." evidently considered this process as identical with the present common "pan process." The Washoe pan process consisted in a continuous amalgamation of the ore, the pulp running directly from the battery through a series of pans. This method of treating the ore in pans was called the Washoe pan process, and was introduced by Mr. Almarin B. Paul, in Gold Hill—who speaks for himself on the subject in another column. It has not the slightest similarity, as we are informed by others, whose judgment therefore stands in opposition to J. S., with the process of Captain Hatch, who simply tried, we believe, to apply the Patio process, in a modified manner, in pans,—which were in fact introduced before Mr. Hatch commenced to operate his process, the latter having had only a short existence.

In California the pan process was originally carried on in a simple iron flat bottomed pan, having stirring arms, to which shoes were here fastened exactly on the principle of the Mexican arastra. In both, the iron arastra, or pan, and the Mexican arastra, the ore was ground and amalgamated under a slow motion. The present pan process has surely little in common with the Mexican copper kettle boiling process, which is especially adapted to chlorides, iodides and bromides. Unless "J. S." can show, therefore, that the principle is the same, we shall have to agree with Mr. Paul that our present pan process is a material addition to the science and practice of metallurgy.

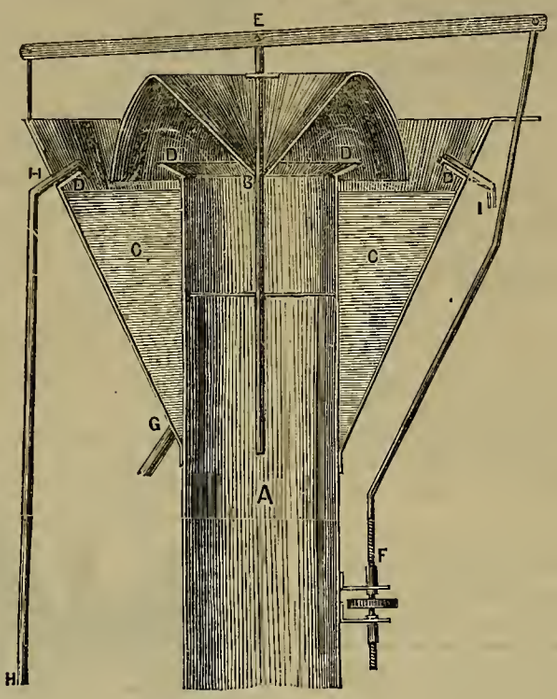
A Good Place for Emigrants.—It is said that in boring wells along the San Joaquin Valley, above Stockton, the augur in most places perforates through about forty feet of rich black soil, before coming to gravel! We question whether any of the Mississippi prairies or Texas bottoms can equal this. If a single acre of this soil could be spread out, it would cover a very respectable New England farm. The farmer who contemplates leaving the Eastern States for a western home, will make a sad mistake if he chooses a farm on the plains of Kansas or Nebraska, which are winter bound a large portion of the year, in preference to locating his family in the San Joaquin Valley, where a delightful climate awaits him, never visited by winter storms, and where a soil of unsurpassed richness can be found, suited to all the varied products of a semi-tropical climate, as well as affording a more abundant harvest of cereals than can be taken from any other land in the world. When the contemplated railroad is pushed out into this region, as it will be within one or two years, these lands will become very valuable. Now is the time to buy while moderate prices prevail.

A Magnificent Boulevard.—The city of Chicago has resolved upon the most magnificent Boulevard in the world. It is to be fifteen miles in length, covering an area of 2,000 acres, and will encircle the entire city. There is no city better situated for such an enterprise, and no municipality better able to execute such a resolve. Applications has been made for leave to borrow two millions at seven per cent. to start the enterprise.

The New Mint Building.—Work is to be commenced immediately on the new Mint building, at the corner of Fifth and Mission streets. The lot is a full 100-vara. Mr. W. P. C. Stebbins is superintendent of construction. He has advertised for proposals for excavating for the foundation.

Benn's Patent Smoke Stack.

We give herewith an illustration of an improved spark arrester, designed for use on locomotives, or other steam chimneys where danger or inconvenience may be apprehended from the issuance of lighted cinders. The subjoined illustration presents a sectional view of a smoke stack with the spark arrester attached. The letters C C, represent a conical shaped vessel, surrounding the upper portion of the smoke stack, and filled with water to a point near, its upper edge. The stack is surmounted by a hollow cone, in such a manner that while the apex enters the mouth of the same, the base is so bent back upon itself as to encircle the chimney, as shown in the engraving. This arrangement, as will be seen at D, D, causes the smoke to so impinge upon the surface of the water that the escaping cinders and dust are thereby arrested, while the smoke and gases rise from the surface of the water, and pass out into the open air. The cone may be readily elevated or depressed by turning the hand wheel F, which works the lever E. The tube H being connected with the water tank, is employed for filling the vessel C, C. The outlet I, prevents the overflowing of the vessel, while a faucet is placed at G, by which the accumulated cinders and ashes may be drawn off when found necessary. The device is certainly very simple, and if it should prove as effective as it appears to promise, it must be very desirable for threshing machines, and wherever else steam power is employed in the midst of highly combustible material. A patent was recently obtained for this invention through the Mining and Scientific Press Patent Agency. Mr. Benn is the inventor of several important improvements, which we may mention in future as occasion presents.



BENN'S PATENT SMOKE STACK.

Further information can be obtained by addressing Walter C. Benn, Stockton, Cal., or calling at Baker & Hamilton's, San Francisco.

Madden Mine, White Pine District. A letter was received in Sacramento, on Tuesday,—says the *State Capital Reporter*,—stating that a cut had been run ten feet into the Madden lead, reaching the vein about seven feet below the prospect hole; and that ore had been struck assaying $850 to the ton. The mine is owned by parties in San Francisco.

Mining and Scientific Press.—The Mining and Scientific Press, published at San Francisco by Dewey & Co., is one of the most valuable of our exchanges.

Miners, mechanics, and the reading public generally, will find its regular perusal profitable and interesting.

Its scope and purpose are expressed in the title, and we recommend miners and mechanics in particular to subscribe for it. Terms $5 per annum, in advance.—*Trinity Journal, March 13th.*

Fire at the California Brass Foundry. Messrs. Gallagher, Weed & Kingwell were unfortunate in having their brass works burned last Sunday night. Their loss is estimated at not less than $3,000, $1,800 of which was insured. Workmen are busy cleaning up and repairing, and business will soon be resumed. The finished work in the front part of the shop was not much damaged. By addition of some new and improved tools and machinery, they intend to be better prepared for work than ever before.

Returned.—Dr. J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M Taylor, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office, without fail.

Photography.—For Cabinet Photographs, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18 6m B. F. Howland.

[From the new "Dominion."]

At this season, when coughs and colds are so prevalent, an effectual remedy, and one easily obtained, is Perry Davis' Vegetable Pain Killer. It is no new nostrum, vended by unknown agents, but has stood the test of over twenty years, and those who use the article, internally or externally, will connect with it grateful recollections of its worthy inventor.—*Hastings' Chronicle, C. W.*

Pain Killer.—The testimonials borne to the efficacy of this valuable medicine are sufficient to warrant its introduction in every house. Our own opinion is that no family should be without a bottle of it for a single hour. In flesh wounds, aches, pains, sores, etc., it is the most effectual remedy we know of. A bottle will last for a very long time, and its low price places it within the reach of all.—*St. John News.*

☞ We are glad to learn that the "Pain Killer" is having so large a sale in our city. We have every reason to believe it to be an almost never failing cure for pain, and a medicine that no family should be without.—*Montreal Pilot.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco Cal., General Wholesale Agents. mlm

Avery Pump and Tube Well.

Complete for Use.

The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand. For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Postoffice box 17.

URRIG & DEWEY,
12v18tf 318 Pine street, San Francisco.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

CALCULATING AREAS—THE LABOR-SAVING METHOD.—The following, from an English engineer in the employ of the Syrian Government, we copy from *Engineering:*

Thinking that any plan for simplifying the rather tiresome calculations necessary for taking out areas, more especially when of curved or irregular surfaces, would be of service to engineers and surveyors, I take the liberty of laying the same at their disposal, so that others may profit by my suggestion, should they find it as useful as I have done.

So as not to be tedious by enumerating the difficulties at present experienced in calculating areas of irregular section, all of which my invention completely overcomes, I will at once proceed to describe the principles on which I have acted.

Principle.—Take paper of good manufacture (traciug or otherwise) and it will ho found that its substance is very accurately distributed; any one square inch weighing precisely the same as any other—even in common papers it varies but slightly. The thicker the paper for my purpose the better.

Example.—Required to find the area of any map.

The paper on which the map is drawn is first to be accurately squared, the area thereof computed in inches, and its weight accurately ascertained. Next proceed to cut out carefully all that portion the area of which is required, and weigh that also. Then as the weight of the whole is to the weight of the portion cut out, so are their respective areas.

Suppose the scale of map to he 20 miles = lin.; size of map, 20in. × 10in. = 200 square inches; weight of map, say 2,000 grains. Then if weight of piece cut out is 1,500 grains, the area of it will be 150 square inches or 300 square miles.

In cases where the plan or map is valuable and is not advisable to destroy it, a tracing of the part required has to he made, and the same process gone through for finding its area.

For iron sections, earthwork calculations, agricultural surveys, etc., it will he found most useful. J. L. HADDON,
Chief Engineer to the Syrian Government.
BEYROUT, Dec. 31st, 1868.

METALS—WHAT ARE THEY?—In relation to this query, a late uumber of the *Mechanic's Magazine* makes the following pertinent remarks: "Wo have no general definition of a metal to show us what const tutes any snbstauce metallic or nonmetallic. This is very odd, as metals aro considered to form such a distinct class from other suhstances. Besides, chemistry is held to be such a marvellously exact science. Still, the most learned in chemistry are not agreed as to what suhstances are metals. Some say 'silicium,' which is its name as a metal; others say 'silicon,' which is its name as a non-metallic suhstance. Then, some take into the list of metals arsenic and tellurium, and others reject them. There apparently is no property yet discovered that is common to the whole list of fifty-two metals. Some even go so far as to consider that a metal may he a compound of two gases, nitrogen and hydrogen. In fact, it is altogether uncertain what constitntes a metal, and what does not. The word metal, apparently, is just a name, without any distinctive and well-ascertained properties attached to it or understood hy it. It is hardly in agreement with the pretensions of onr chemists that there should he such looseness and uncertainty about the application of a name, and a namo of such importance, which represents such a common class of suhstances."

THE GARDEN OF CHINA—The Chinamen who walk over bridges hnilt 2,000 years ago, who cultivated cottou hefore this country was heard of, and who fed silk worms hefore King Solomon hnilt his throne, have 50,000 square miles around Shanghae, which they call the Gardeu of China, aud which have been tilled by countless generations. This area is as large as New York and Pennsylvania combined, and is all meadow, lakes, rivers, canals—a complete net-work of communication; the land under the highest tilth; three crops a year harvested; population so dense that, wherever you look, you see men and women in blue pants and blouse, so numerous that you fancy some fair or muster is coming off and all hands have turned out for a holiday.

NEW ILLUMINATING MATERIAL.—A new illuminating material, recently patented in Germany, consists of a mixture of two parts of the poorest rape seed oil and one part of good petroleum. It is hurned in a lamp of peculiar construction, but somewhat similar to that of the ordinary moderator lamp, and gives a light not to he surpassed for purity and hrilliancy.

THE ROYAL MINING ACADEMY IN BERLIN. As this Mining Academy is a scientific institution of the first rank in Germany, the following notice concerning it may be interesting to the scientific public: The lectures of the Mining Academy are arranged in such a manner that a student may finish the complete course in two years; the students also enjoy the privilege of inspecting the different Prussian mining and metallurgical establishments during the vacations, and besides several times yearly they have the opportunity of excursions to those establishments in company of the professors. The lectures of the present half year, commencing on the 2d of November last and ending on the 19th of March, 1869, treat of the following subjects:

1. Mining Technology — five lectures weekly by Bergrath Hauchecorne; half yearly.
2. Technology of Saltworks—one lecture weekly by Bergrath Hauchecorne; 3s. half yearly.
3. General Metallurgy — four lectures weekly by Professor Kerl; 12s. half yearly.
4. Metallurgy of Iron—four lectures weekly by Bergrath Wedding; 12s. half yearly.
5. Foundiug and Molding—three lectures weekly by Dr. Dürre; 12s. half yearly.
6. Chemical Technology—two lectures weekly by Professor Kerl; 6s. half yearly.
7. General Assaying—six lectures weekly by Professor Kerl; £1 7s. half yearly.
8. Blowpipe Assaying — two lectures weekly by Professor Kerl; 9s. half yearly.
9. Assaying of Iron — three lectures weekly by Bergrath Weddiug; 13s. 6d. half yearly.
10. Petrography—four lectures weekly by Dr. Laspeyres; 12s. half yearly.
11. Geology, with special attention to the Stratified Formations—four lectures weekly by Professor Beyrich; 12s. half yearly.
12. The Geological Formation of the Globe—one lecture weekly by Dr. Lossen; gratis.
13. On Volcanoes—one lecture weekly by Professor Roth; gratis.
14. Mineralogical Repetitions—four lectures weekly by Professor G. Rose; gratis.
15. Mineralogical Exercises—four lectures weekly by Dr. Eck; 12s. half yearly.

22. Surveying of Mines—four lectures weekly by Berg-Assessor Kauth; 12s. half yearly.
23. Instructions in Drawing—eight lessons weekly by Berg-Assessor Kauth; gratis.
24. Law of Mines—two lectures weekly by Geh. Oberbergrath Ackenbach; gratis. *London Mining Journal.*

THOSE PROPHETS OF OLD!—How rich the following paragraph appears, which was originally printed in the *English Quarterly Review* in March, 1825: "We are not advocates for visionary projects that interfere with useful establishments. *We scout the idea of a railroad as impracticable!* What can be more palpably absurd and ridiculous than the prospects held out of locomotives traveling *twice as fast* as stage coaches! We should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's ricochet rockets, as to put themselves at the mercy of such a machine, going at such a rate."

GEOLOGICAL SURVEY.—The result of the geological survey, under Prof. Hayden, of the coal fields of Wyoming and Colorado, is being published at Washington. These coal fields cover thousands of acres, and are from five to fifteen feet in thickness. The Union Pacific Railroad runs through the best of them.

CANNING FRUITS NOT NEW.—The plan of preserving fresh fruits and vegetables by bringing them to the boiling point in a liquid and then sealing them up, is by no means as new a thing as is generally supposed. Appert, a Frenchman, suggested and practically tested the thing more than a hundred years ago, and Gay Lussac, the celebrated chemist, wrote a report upon it, fully endorsing the same and suggesting its general use. But probably through the lack of any adequate means of bringing it directly before the masses of the people, the matter was allowed to drop. The modern newspaper is a wonderful aid to the spread of information. Without its assistance a large proportion of the labors of inventors and discoverers, in all the various walks of life, would be useless for themselves or the world—a knowledge of but few of their inventions or discoveries would ever pass beyond the circle of their own immediate friends and acquaintances. Inventors, generally, have a full appreciation of the utility of newspapers in bringing out and making known their inventions. Our own experience with California inventors enables us to speak from the book in this particular.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, and newspaper printing office,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number—414 Clay street, below Sansome.

SILVER COMET

Mining, Mill and Tunneling

COMPANY,

White Pine District,

NEVADA.

This Company's claim adjoins the celebrated Virginia Mine, on TREASURE HILL.

From its outcroppings and the richness of the Virginia and other mines which have been opened in the immediate vicinity, the prospective value of this mine is not exceeded by any in the District. With a view to the immediate and vigorous prosecution of work in opening this mine, the Board of Trustees propose to sell a limited number of the reserved UNASSESSABLE Shares of Capital Stock at the nominal price of $2 50 per share, the entire proceeds of which will be devoted to developing the mine.

Only **1,000** Shares will be sold at the above named price, and a portion of that number has already been engaged.

In issuing Stock the subscribers will take precedence in the order of their names.

The Books of the Company are now open for subscription at the Secretary's office, 417 Kearny street. By order,

12v18-1t IRA G. HOYT, Secretary.

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns, of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment or one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including mates and females Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. LeRoy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Gunnison, Attorney at Law, San Francisco; H J. Offices to Let.

Two convenient front rooms (No. 9 and 10) in second story of No. 423 Washington street, to let on favorable terms Apply at this office, up stairs. No. 414 Clay street.

Resources and Developments.

IMPROVED GRAPE GROWING.—The Sacramento *Bee* says that a new wine-making and grape-growing company has been organized in Sacramento, the object of which is, by the concentration of capital and ability, to make wine of superior quality at cheap rates; and to help redeem the disrepute into which we are likely to fall as vinters, because of the numerous parties who undertake to make wine without knowing the first rudiments of the business.

SAWMILLS WANTED.—The Los Angeles *News* says there is a great want of sawmills in the vicinity of the Soledad mines. There is timber in abundance, and a ready market for the lumber, and but little road-making needed.

IRRIGATING CANAL.—The Los Angeles *News* says that one of the most notable enterprises, looking to the development of that region, which has been recently undertaken, is an irrigating canal, now being constructed for the improvement of the San Pascal Rancho, by Mr. B. D. Wilson and Dr. J. S. Griffin. This tract of land consists of several thousand acres which will become very productive as soon as it can be furnished with water for irrigation. It is well calculated for vines, semi-tropical fruit or cereals. The *News* thinks this undertaking will do much by affording substantial evidence of what may be done in other similar situated localities. It expresses the opinion that millions of dollars might be added to the commerce and business of that county by a few other enterprises similar to this.

OLIVE TREES.—The Los Angeles *News* says two hundred thousand olive cuttings have been set out in Santa Barbara County the present season.

CASHMERE WOOL.—The Folsom *Telegraph* has a piece of wool from a Cashmere buck, the property of Oakley & Shirley, about one-quarter blood. The staple is about ten inches in length, exceedingly fine, and has a beautiful appearance. These gentlemen have a fine range in that county, and a large flock of goats. The wool is worth from a dollar and a half to five dollars, the price depending upon the length of the staple, some of it reaching twenty inches in length. The annual clip being about five pounds to the goat. The *Telegraph* thinks there is a fortune in prospect for enterprises of this kind.

WHEAT ON RED SOIL.—The Yreka *Union* says that Mr. Richardson, of Willow Creek, in that county has sowed some tough red soil with wheat as an experiment. It came up quicker and looks better than that sown on the black soil usually cultivated, but whether it will come on and mature properly is yet to be determined.

MULBERRY BUSINESS THRIVING.—The Nevada *Gazette* says the planting of mulberry trees in that section, with the ultimate view of raising silkworms and the production of silk, is increasing.

WALNUT TREES.—The Yolo *Democrat* says that in various parts of that county quite a number of walnut trees have been planted this season. Until recently there were but few trees of this species in the county. The oldest and largest, perhaps, is one planted several years ago by J. A. Price, at Cottonwood. The tree referred to is a thrifty nut-bearing and beautiful shade tree, the trunk of which is about twelve or fourteen inches in diameter.

A PLANTATION of 4,000 mulberry trees will be laid out shortly in Analy township, Sonoma county.

New Job Printing Firm.

In order to devote our attention more exclusively to the publication of our paper, and the business of our American and Foreign Patent Agency, we have disposed of the presses and job printing material, and fixtures, in our office—with the entire future good will and patronage of our JOB PRINTING OFFICE,—to George Spaulding and Harrison Barto. Messrs. Spaulding & Barto will continue the operation of the same, in our office, 414 Clay street, under the title of "The Mining and Scientific Press Job Printing Office."

Both of these gentlemen are practical printers of good attainments and enviable reputation. They have been long engaged in this office, and it is with pleasure that we can recommend them to the favor and patronage of all our old customers in the line of Job Printing. A. T. DEWEY.
W. B. EWER.

P. S.—This change relates to our job printing department alone, our patent agency and newspaper business remaining as before.

DEWEY & CO,
Mining and Scientific Press Office, 414 Clay street.
MARCH 1, 1869.

New Incorporations.

Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ALBERMARLE MINING CO.—White Pine, Nev. March 20th, Capital stock, $1,200,000; 1,200 shares, $100 each. Trustees: Geo. O. Ecker, John Nightingale, Edward Chevessus, Geo. S. Ladd and Charles Keading.

MOUNT MORIAH S. M. CO.—White Pine, Nev. March 20th. Capital stock, $300,000; 6,000 shares, $50 each. Trustees: Carl Precht, Louis Cohn, D. W. Taylor, Thos. Ausbro and A. De Laud.

GRANT INVINCIBLE S. M. CO.—White Pine, Nev. Capital stock, $800,000; 8,000 shares, $100 each. Trustees: S. B. Whipple, C. W. Chase, A. Hayer, S. C. Burley and Theo. Reichart.

GREAT REPUBLIC MINING CO.—White Pine, Nev. March 25th. Capital stock, $1,000,000. Trustees, same as Silver Star Co.

SILVER CROWN S. M. CO.—White Pine, Nev. March 25th. Capital stock, $1,000,000. Trustees, same as Silver Star Co.

EUREKA S. M. CO.—White Pine, Nev. March 25th. Capital stock, $1,000,000. Trustees, same as Silver Star.

BAY PARK HOMESTEAD ASSOCIATION.—San Francisco. March 23d. Capital stock, $117,000; 325 shares, $360 each. Trustees: A. S. Gould, F. B. Wilde, J. Riudleberger, C. E. Dunshee, W. A. Woodward, H. F. Williams and J. W. McKenzie.

ORLEANS MINING CO.—Nevada County. March 20th. Capital stock, $500,000; 5,000 shares, $100 each. Trustees: J. P. Pierce, A. Delano and E. L. Tuttle.

LATAWANA MINING CO.—White Pine, Nev. March 25th. Capital stock, $192,000; 1,020 shares, $100 each. Trustees: J. A. Drinkhouse, E. W. McKinstry, Geo. Pratt, Thos. J. Poulterer, John H. Wise, N. Hayes and R. Savage.

ELECTION OF OFFICERS.—CONSOLIDATED CHLORIDE FLAT M. CO.—White Pine, Nev. March 24th. Trustees, A. Huyward, Thos. Bell, A. E. Head, J. D. Fry, W. B. Thomburg; President, J. D. Fry; Secretary, Chas. E. Elliott.

DAVE WILLIAMSON TUNNEL AND M. CO. White Pine, Nev. March 25th. President, Geo. S. Evans; Secretary, Wm. S. Ustick; Engineer, D. Wilson.

LATAWANA M. CO.—White Pino, Nev. March 25th. President, J. H. Wiso, Treasurer, J. A. Drinkhouse; Secretary, A. Martinon; Superintendent, R. Savage.

TO TEST FLOUR.—Place a small quantity in the palm of the left hand and rub it gently with a finger of the right. If it feels very smooth, silky and slippery, it is of inferior quality, though ever so white. It is badly ground and made from damaged wheat, or perhaps containing too much gluten. But if it feels a little rough on being rubbed, and has a slight orange tint, you can depend with much confidence on its being a good article and one that will make excellent and nutritious bread.

New Mining Advertisements.

Pacific Coal Mining Company, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of March, 1869, an assessment of four dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. LACHMAN, Secretary.
Office, southeast corner Market and First streets, San Francisco. mar27

Machinery.

VARNEY'S
PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

21v17-qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. H., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT

STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and will even boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skilful application of their soluable principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adopting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be overrated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must settle them selves settle the same.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MECHANICAL AND ARCHITECTURAL
Drawing School
—FOR—
APPRENTICES.

MR. FREDERICK HELLERT,

An experienced Draughtsman and Teacher, has opened an Evening School at No. **414** CLAY STREET (same entrance as the Mining and Scientific Press Office), where he is giving thorough instructions in DRAWING to apprentices who are inclined to self-improvement. His terms are moderate and within reach of the humblest apprentice; and we are pleased to say that the enterprise is meeting with success.

1v18.tf

From the Foot Hills and Mines.

We obtain the following items from notes sent us by our agent W. H. M.:

CENTRAL PACIFIC RAILROAD.

The trains that leave Sacramento now consist usually of four passenger cars, which are taken up to the summit by two engines. The cars are well filled, about half of the men being bound for White Pine. Some women, with dogs and cats, were also noticed, who procured tickets for Elko.

AT AUBURN,

Placer county, the Green Emigrant mine, Capt. C. Lind superintendent, has been at a stand still for six weeks, being filled up with water. There is a mill, and forty or fifty holes are dug into the hill, not built over by sheds. Very good rock has been struck, but no ledge yet found well enough defined to warrant the putting up of hoisting works.

AT GRASS VALLEY

Frank Morris has put a fine 8-stamp water power mill on Wolf creek. It can be run for $25 less than a steam mill, and has plenty of ore to crush. He uses eight of Knox's old pans. There are 45 men employed in the mill and mine belonging to the same parties, the latter producing 400 tons per month, from a depth of 150 feet, assaying $25 to $30 to the ton, the ledge being 18 inches wide.

The Allison Ranch mine will start up again early in the spring.

At the Young America mill and mine, two miles from Grass Valley, there are 22 men, all Irishmen, working on shares, getting ten per cent of what is taken out, the contract lasting for several years longer. The boys are striving hard to make it pay well.

At the North Star mine or French lead some gold quartz is produced of a good enough quality for breastpins, and which is sold for that purpose. The pumping apparatus of this mine was made at M. C. Taylor's Foundry, Grass Valley, and cost $30,000. The miners are required to change their clothing on coming out, to prevent peculation. Wood is getting scarce and has to be hauled from three to six miles.

Idaho Correspondence.

MINING.

EDITORS PRESS: I have before spoken of the Varieties lodo of Yuha District, Alturas County. Seven pounds of ore from that lode was assayed and run into a bar of gold value $15, being $4,285.71 per ton. The owners are Wm. Clemens and J. B. Barnhart, and the above was tested by J. D. Heath, and assayed and run into bar by Prof. Liebnaud, of First National Bank of Idaho. In spite of winter weather, every company there is making active preparations for work this summer, with firm confidence in the future of Yuba.

THE BOISE VALLEY WATER DITCH

is so far completed that the Superintendent, Mr. J. B. Walling, purposes to turn in a head of water on Monday next, and our citizens are planting out fruit and shade trees and gardens, so that we shall present a more cheerful appearance than heretofore.

THE FARMERS

are making preparations for larger crops than ever before, and in spite of the cry of hard times, every one looks forward with hope. PEGASUS.

Boise City, I. T., March 19th, 1869.

THE LONDON UNDERGROUND RAILWAY.

Over this road runs a train every three minutes during the business part of the day. The constant use of the electric telegraph prevents the possibility of any collision. Thirteen millions of passengers have been carried over this road in six months. No smoke is given out by the engines in the tunnel. The steam is got up to 130 or 140 pounds pressure at the starting point, where the line is open, and when the train enters the covered way the damper is closed and combustion is practically prevented. The engine then continues to run on the steam already made so long as it is in the covered way, the pressure being generally lowered to eighty pounds when it emerges again into the open cut. The steam, instead of escaping into the tunnel, is conveyed by pipes to a condousing tank, which is filled with cold water at each end of the journey. Four carriages are usually run in a train. They weigh about fourteen tons when empty. The speed is usually fifteen miles an hour, including stoppages.

PATENT OFFICE FACTS.—The Secretary of the Interior, in his annual report to Congress, states that during the year ending September 30, 1868, there were 20,112 applications for patents; 14,153 patents (including reissues and designs) were issued; 1,692 applications allowed on which patents did not issue owing to the non-payment of the final fee; 3,789 caveats filed; 180 applications for the extension of patents received, of which 133 were granted. The receipts were $696,786, being $171 less than the expenditures. The Secretary also renews his former suggestion in favor of repealing so much of the law as allows an appeal from the decisions of the Commissioner on application for letters patent and in interference cases, and respectfully refers to the views on the subject presented in his former reports.

Heretofore the Judges of the Supreme Court have been paid a fee of $25 in each and every case of appeal from the Commissioner of Patents. Hon. Elisha Foote has come to the conclusion that such payments are illegal, and has discontinued the same, so that now until some legislation is had in the matter by Congress, no fee will be required for an appeal to the Judges of the Supreme Court.

STYPTIC PAPER.—A French recipe for preparing paper to be carried in the pocket for application to small wounds to arrest hemorrhage, is as follows: A mixture of one pound of gum benzoin, one pound of alum, and four and one-third gallons of water is to be kept boiling for four hours, and skimmed from time to time. The water evaporated is to be replaced by the same quantity of fresh water, and, as soon as the solution is cooled, it is to be filtered off. The paper is then dipped into it, kept there until saturated, and then dried. When dry, a solution of the perchloride is applied by a brush. The paper is folded up and preserved from the action of the air in a piece of waterproof taffeta.

MOSQUITOS, FLIES, ANTS, ETC.—F. Jager, a German traveler in the East, says: "A tincture prepared by macerating one part of pyrethrum roseum in four parts of diluted alcohol, and when diluted with ten times its bulk of water, applied to any part of the body, gives perfect security against all vermin. I often passed the night in my boat on the ill-reputed rivers of Siam without any other cover, even without the netting, and experienced not the slightest inconvenience. The 'buzzing' at other times so great a disturber of sleep, becomes a harmless tune, and, in the feeling of security, a real cradle song. In the chase, moistening the beard and hands protects the hunter against flies for at least twelve hours, even in spite of the largely increased transpiration due to the climate."

MILD WINTERS.—The past winter has been mild in Europe as well as upon our own continent; and the "fact" hunters state that in 1822, 1807 and 1791, the temperature was as unusually warm as it is this year; that in 1692 the Germans never lighted their stoves; that 1617, 1612, 1607 were likewise wonderfully mild; that in 1538 the gardens were full of flowers in the month of January; that in January, 1421, cherries ripened, and grapes in May; and that in 1172 the trees were covered with leaves, flowers bloomed, and birds built their nests, while the little ones fledged in the mouth of February.

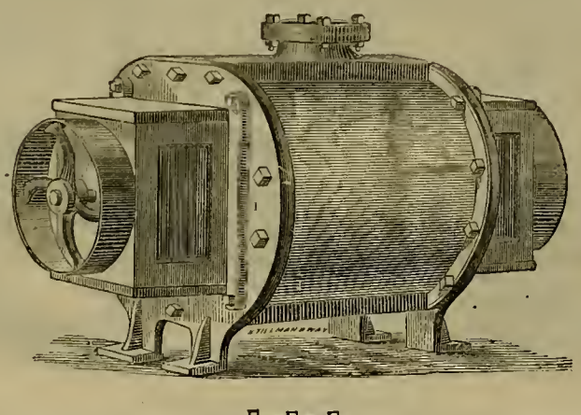
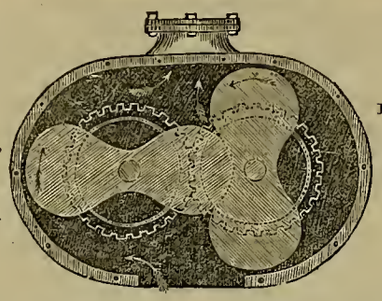
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1860; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

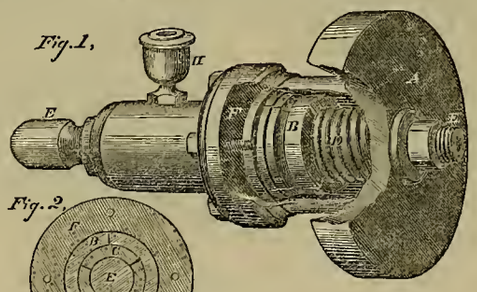
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

COLLIER & SILLIMAN'S
METALLIC PRESSURE PISTON ROD PACKING.



This invention relates to the packing used to render piston rods or propeller shafts steam and water tight, and has for its object the construction of a metallic packing, which shall be operated upon by gas, the vapor or liquid exerting the pressure, in such a manner as to form a perfectly tight joint. It also consists in so forming the gland of the stuffing box, that it shall serve as a support and guide for the rod and shaft, and at the same time afford great facility for lubrication.

Two small openings now connect the interior of the cage with the source of pressure—as the cylinder in an engine or pump, or the water outside of the ship if it is for a propeller shaft—so that the greater the pressure the closer are the rings forced against the rod and inner face of the gland. In any case the Packing is to be applied to a water or air pump, so that the pressure will come from the liquid or the gaseous substance, as the case may be. One of the most important uses of this Packing is in the stuffing boxes of propeller shafts, in which case the openings connect with the outside water, the pressure on the rings depending upon the depth to which the shaft is submerged. This device is simple, and not easily got out of repair; is perfectly efficacious and self-regulating, and in the case of shafts, especially, will do away with the great expense of repairing the derangements of the stuffing box which now so frequently occur. This new invention has already been adopted on the Central Pacific Railroad and by some of the principal Flouring Mills in San Francisco and Sacramento, and is growing at once into popular favor. A description of the engraving accompanying this will be found in the *Mining and Scientific Press* Jan. 9, 1869, and in the patentees' circular, which can be had free on application.

Certificates of Recommendation:

OFFICE C. P. R. R. CO. OF CAL., Sacramento, Nov. 24, 1868.—*To Whom it may Concern:*—This Company has made a thorough practical test of Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and accordingly recommend it to all others interested.
E. B. CROCKER, Gen. Agent C. P. R. R. Co.

THIS IS TO CERTIFY, that we have been using the Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and would recommend it to all others interested.
SETH H. GARFIELD, Prop. Pioneer Mills, Sac. City; WM. ETCHELLS, Engineer.

For sale at the principal Machine shops and Foundries in San Francisco. Full particulars can be obtained by addressing ORRIN COLLIER, Sacramento, Cal., or E. B. SILLIMAN, Bridgeport, Ct.

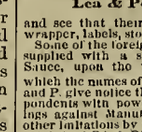
LEA & PERRINS'
CELEBRATED
WORCESTERSHIRE SAUCE



Declared by connoisseurs to be the only
GOOD SAUCE.

The success of this most delicious and unrivalled condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine, is to ask for

Lea & Perrins' Sauce,

and see that their names are upon the wrapper, labels, stopper, and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against Manufacturers and Vendors of such, or any other infractions by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on the Wrapper, Label, Bottle, and Stopper.

Wholesale and for Export by the Proprietors, Worcester; Crosse & Blackwell, London, etc., etc.; and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 3v18-1y

SULPHURETS;
What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.

By WM. EARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

New Patents Issued to Pacific Coast Inventors.

FOR THE WEEK ENDING FEBRUARY 23d.

87,132.—IMPROVED AMALGAMATED PLATE FOR COLLECTING GOLD AND SILVER.—Melville Attwood and John Roach, San Francisco, Cal.:

1. I claim zinc amalgam for coating metal surfaces, substituting the same for amalgamated copper for collecting precious metals, substantially as described.

2. The application of mercury to metals covered with zinc, substantially as and for the purposes herein described.

If successful, this invention will prove one of immense importance in the production of the precious metals, both cheapening and greatly extending the use of amalgamated plates. We shall speak of it again.

87,222.—IMPROVEMENT IN STEAM ENGINE LUBRICATORS.—George W. Teasdale, Lexington, Cal.:

1. I claim in combination with the globe A, the tube B, extending to near the top, and the screw E, for regulating the supply, substantially as herein described.

2. The supply-passage H, together with the float J, and stem K, for closing the passage and indicating the quantity introduced, substantially as herein described.

3. The passage C, and cock D, when arranged in relation to the above, as herein described.

This relates to that class of oil cups from which the lubricant is introduced to the cylinder, or other point of application, against the pressure of steam, and also to such as should furnish a constant supply of oil; and it consists in so constructing the globe that after it has been filled with oil or tallow, it will allow a small quantity to pass continuously to the point where it is needed, till it is all exhausted. This is effected by constructing the globe with a discharge pipe passing through the bottom to the point of delivery and rising within it to near the top. The steam rises through this pipe, and a small portion is constantly being condensed. This condensed water, by its greater gravity, sinks to the bottom of the globe, and thus raises the oil so that it flows down the tube and supplies a small quantity continuously till the globe is full of water and the oil or tallow exhausted. The water is then drawn off by a cock at the bottom, and the globe again filled with oil. A small float is so arranged in the upper part, that when the globe is full, it rises and closes the supply tube, and shows that enough has been introduced, after which the process goes on as before.

87,168.—EXCAVATING MACHINE.—Peter W. Hamel, San Francisco, Cal.:

I claim the roof R, over the working end of the conveying buckets, to protect them from land slides, substantially as described.

This is an improved excavator or digging engine, designed to work in sand or light earth, constructed so as to be removable on rails, and having buckets similar to our ordinary dredging machines, but so arranged as to work continuously. It has also a roof or covering over the working end, to protect the buckets from the effects of slides and a consequent clogging or stoppage of the whole machinery.

The following will be published with claims and notices on receipt of patents:

FEBRUARY 16th.

86,898.—WASHING FLUIDS.—James Bell, of Sonora, Tuolumne Co. Cal.

86,931.—WINDING RATCHET.—For Timepieces.—Wm. H. Lamb, San Francisco.

86,932.—BRICK ELEVATOR.—Thomas Mann, San Francisco. Ante-dated Feb. 1, 1869.

87,020.—MOTIVE POWER FOR SEWING AND OTHER MACHINES.—Jacob Zuckerman, San Francisco.

87,077.—ELEVATED RAILWAY.—William A. Sutton, New York, and Eugene Crowell, San Francisco.

87,082.—FOLDING CARD GLOBE.—Dennis Townsend, Fiddletown, Cal.

MARCH 2d.

FOLDING SEAT FOR STREET CARS.—Charles H. Foster, San Francisco.

PROCESS OF WORKING SILVER ORES.—Henry Jauin, Virginia City, Nev.

HORSE-SHOE.—William Rickie, Stockton, Cal.

OSCILLATING ENGINE.—Horace Bartine Martin, San Francisco.

BOOT DETACHING APPARATUS.—E. Wakeman, Brooklyn, Cal.

PROJECTILES.—R. H. Jones, San Francisco. Ante-dated Feb. 21st.

APPARATUS FOR CONCENTRATING METALLIC ORES.—Zenas Wheeler, San Francisco.

BOOT DESIGNS.—Amelia Straing, Oakland, Cal.

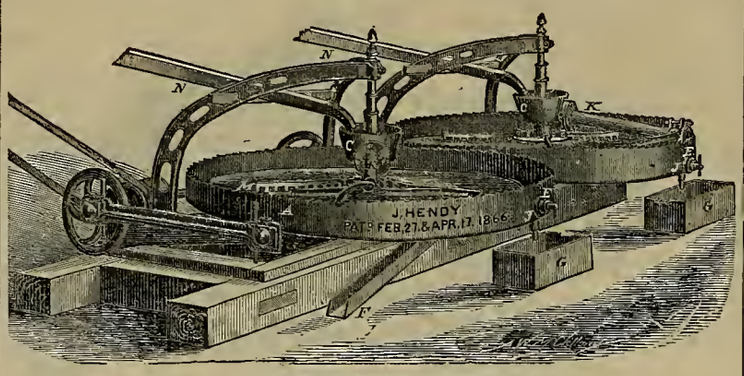
PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.



A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

OFFICE OF NORTH STAR MINE, GRASS VALLEY, Nov. 12, 1868.

JOSHUA HENDY, ESQ.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

Office at Union Iron Works.

13v17tf

DEWEY & CO.

U. S. AND FOREIGN

PATENT AGENCY

FOR THE PACIFIC COAST.

Office, No. 414 Clay Street,

SAN FRANCISCO.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or Foreigners, male or females, (including minors), and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service.

Confidential Advice.

We invite consultation (in person or by mail) regarding new inventions, for which we make no charge. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests guarantee, and the thousands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

Advantages of Our Agency.

Inventors on the Pacific Coast can sign the papers at once, and save at least two months' time in securing patents through our office. When desirable they can visit and give us personal explanations—better than written instructions.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

From long experience in the business, and an intelligent and thorough understanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents*.

We guarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are actually secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

Information for Inventors,

Printed in circular form, containing list of Government and other fees, sent free.

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and foreign patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

California inventors should beware of placing their inventions and money in the hands of persons not well known as honest, responsible and capable.

Patent Office Reports.

We have the only complete set of U. S. Patent Office Reports (from 1844) on this coast; a full record of all patents issued since 1790; Record of British patents from 1801 to 1845, and full files of scientific papers containing illustrations and list of U. S. Patent Claims, forming the only extensive library of patent works west of the Rocky Mountains. We offer patentees and inventors the free use of these books at our office. The files of the MINING AND SCIENTIFIC PRESS contain the claims of the Pacific Coast Patents, and many illustrated descriptions of the same. We have also in our office *full copies* of a large majority of the patent cases emanating on the Pacific Coast.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERAL GY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v8-1y16p

San Francisco Mining Shareholders' Directory.

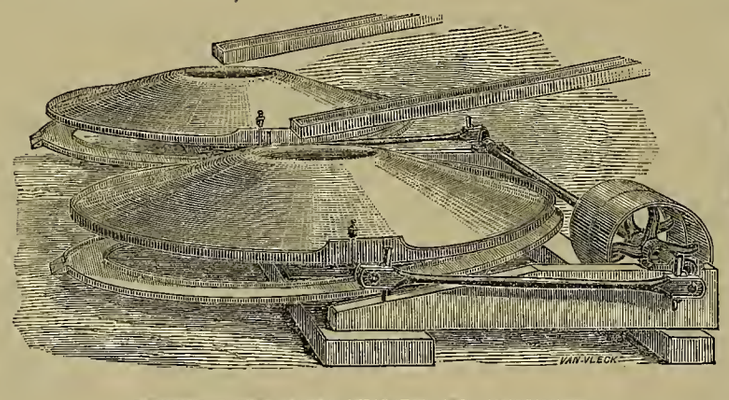
THE SHADY SIDE of this week's White Pine history, as it develops itself, may be summed up in a growing distrust of wild-cat, and in doubts of continued very rich yields from the renowned deposits of the district. Wild-cat is very innocent as yet, so little work having been done that the evil nature of the beast has not become apparent. Two hundred millions of capital stock to several hundred of actual working miners in our "mountain of solid silver;" the weekly and monthly bullion product, as stated in another column, noted in comparison; and the fact that companies consider themselves dealing in millions when the workings are but very shallow, and the ground unexplored in the regular mining sense, are facts not to be overlooked by the excitable. Where the ore occurs in seams and pockets, and is so liable to run out, it is not strange that there should be a disposition to sell out, with fine imaginative colorings thrown in gratis to accompany beautifully executed stock certificates, rather than to strike the pick at one blow through a promising vision into hard realities and underground sterility. One correspondent "understands" that the Eberhardt is getting poorer every day. The fact, if it prove a fact, characteristic of that region (as is quite possible), that silver quartz does not run very definitely in ledges, but that the laws of veins are so modified by the intangible and broken-up character of limestone as to prevent all systematic pursuit of the ore, will decide merely that we shall have to expect White Pine to be a field for "luck," rather than for solid work for some little time to come, until White Piners shall have more thoroughly learned to read the method and manner of the distribution of the vein matter which is interesting to them—quartz, spar and chloride, or the sulphide mineralizers of silver which take the form of carbonates at the surface.

"What bothers me," writes a White Piner, "is to know what one-tenth part of the people who are coming here will do. When you come to speak seriously with those who are deeply interested here, they will generally admit that they are going to make somebody pay for their time, and they say it will last one or two years."

We might quote a great deal of matter unfavorable to White Pine, but it is generally expressed in a style of conclusion evidently premature. The Reno *Crescent* points significantly to the actual bullion product of the Eberhardt, and candidly expresses the belief that "White Pine is not a region that will ever exhibit extensive mining operations."

Johnson's Patent Batea Separator and Amalgamator.

All experienced millmen know that the principal waste in milling gold and silver ores is from the loss of granulated or powdered mercury, and the gold and silver that is carries off with it, in an amalgamated state. A common wet-battery may be considered a perfect amalgamator. The mercury put into the same is, by the action of the stamps, kept in a constant spray throughout the battery; all the gold, no matter how fine, is amalgamated almost as soon as it is liberated from the rock. The same may be said of the pan and barrel process. But the sulphurets contained in the rock, and the wear of metallic iron, whether in shoes, dies, or the grinding surface of iron upon iron, as in pans, corrupts the mercury and coats it with a film of iron or other extraneous matter. When the



JOHNSON'S PATENT BATEA SEPARATOR AND AMALGAMATOR.

mercury, so coated, comes in contact with stamps, or is subjected to any arbitrary friction, it is divided and subdivided into minute particles, each one assuming a globular form, until it becomes so fine that it will float upon the surface of even placid water; but a slight agitation will precipitate it to the bottom, with the other heavier metals. The chief object sought to be gained by the different sulphuret concentrating machines now in use, is to collect the powdered mercury *with* the sulphurets, and pass off the lighter and useless sands. By this process the separation of the precious from the base metals is incomplete; as the sulphurets carrying with them the powdered mercury have to be subjected to a further separating process before the object sought is attained, and at a cost for labor and machinery which, oftentimes, only high grade ores will justify.

In Johnson's separating machine it is claimed that the desideratum of saving the powdered mercury is fully accomplished, in one process, and that without extra cost for labor—making the machine an important acquisition to mill owners, even in the working of the lowest grade of ores; as, for instance, taking the stream directly from a wet battery, where it is allowed to run to waste, or at the discharge from the amalgamating pans or barrels, the loss from which is not sufficient to pay for saving by any other process.

These machines are made of cast iron, five feet in diameter, and covered with sheet copper, which will be constantly coated with mercury. They require but very little power, and no attendance or expense after being set in motion. They are designed to receive the stream from a battery or from amalgamating pans. The movement will be seen by reference to the engraving, at a glance, by every practical mill man, and will keep the sands and sulphurets loose and in constant motion from center to circumference. The powdered mercury containing gold or silver, is, by the law of gravitation, precipitated to the bottom on the copper. The weight of the loose sand and water, together with the movement of the machine, will cause a gentle friction, sufficient to concentrate the powdered mercury. When concentrated, the amalgam adheres to the copper, whilst the mercury flows on down to the recess in the rim, where it is confined, and the sands and sulphurets are allowed to discharge over the top of the rim all around upon a circular apron, terminating in a sluice. This machine is simple, new, novel and to all appearances should prove effective. The machine is about five feet in diameter, and will weigh about 1,000 pounds. The The cost, for a pair, will be about $500, or $300 for a single machine. The inventor is Mr. S. Johnson, of this city, who has obtained a patent for the same through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Manufactured and for sale by Howland, Angel & Co., at the Miners' Foundry.

IMPORTANT IMPROVEMENT.—The enterprising publishing house of H. H. Bancroft & Co., of this city, have purchased a lot on Market street, a short distance west of Third, running through to Stevenson, on which they will erect an immense building, sufficiently large to accommodate, for some time to come, their increasing business. This structure will be first class in construction, and as near earthquake-proof as bricks and iron can be made.

Efficient Fire Departments.

How important a desideratum fire departments of the greatest possible practical efficiency are in large cities, need not be asserted after witnessing the havoc and pitiable ruin occasionally made in a few minutes' time by an unchecked conflagration. It is gratifying to be able to note that very few destructive fires have occurred in San Francisco, for a long time, notwithstanding our wooden houses and high winds. Without unduly praising our Fire Department for this result, the reasons are evident. Our telegraphic alarm, and paid steam fire engine systems are efficient. The city's employés are wide awake. No fire can break out but that, with the greatest certainty, in a few minutes there is a powerful steam-projected deluge of water playing upon it; and all the appointments are in the hands of experienced persons, who know the character of every building in their precinct.

Comparing this system with others still in vogue in nearly all of the sleepy ancient cities of the old world, one may be excused for taking some little pride in American handiness. Prevention there, as in the tinsel and wooden cities of China and Japan, is the chief reliance. When a fire does occur in those ancient centers of civilization, the effect is rather ludicrous to our traveling barbarians. One will witness on the continent for example, a commotion on the streets, caused by some very unmusical demonstrations from a long old-fashioned country dinner horn, projecting from the topmost habitable cranny of an adjacent church steeple. The firemen depart hastily for their homes to don the proper legal dress, and in due time—a quarter to half an hour, perhaps—a few ridiculously inadequate machines—small-wheeled, antiquarian curiosities—are dragged along. The military with their muskets come to the rescue in large force, but not to work, their business being simply to wall out the populace. If the building burns down quietly, and the adjoining fire-wall does its duty, the demonstration is considered successful.

A recent illustration of the efficiency of our paid fire department, occurring very near home, demands especial notice in the MINING AND SCIENTIFIC PRESS. On the floor underneath this office a fire broke out at 5 o'clock on Tuesday morning last. Damage was done on the lower floor amounting to about $1,000. The firemen broke open our doors, passed through, chopped a hole through the floor in the rear, and extinguished the flames without causing a trifle of damage in the office, or even pieing any type. Under the old system this item might have amounted to many hundreds of dollars.

THE OVERLAND MONTHLY for April contains articles entitled "Outside the Lines," "A Day in Panama," "A Cup of Rio Coffee," "A Consulate among the Fejees," "A Prospector's Story," "Touch of Nature," "Chinese Women in California," "Savings Banks of California," "On the Texan Prairies," and poetry entitled "To-day," "Friar Pedro's Ride," and "Sunset from 'Puu Mahoe.'"

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Written for the Mining and Scientific Press.

Steam Plowing.

The New York Society of Practical Engineering held its regular meeting at the Cooper Institute, on the evening of the 16th of February, James A. Whitney, President in the chair, William B. Harrison, Recording Secretary. Dr. A. W. Hall read an elaborate paper on "Steam Plowing in England and America, its History, Systems and Connections with the Bread Supply."

In approaching the subject of Agricultural Engineering, and especially that part relating to steam tillage, the speaker was not unmindful, he said, of the skepticism which prevails as regards the steam plow ever being made to take the place of plowing by animal power in this country, but argued that the partial success of many steam plowing devices in this country and Europe, showed these skeptics not justified by the facts in the case. In proceeding with his topic, he touched upon many collateral subjects, and particularly the resources of this country, agricultural and mineral. He showed by statistics, that with our agricultural resources properly developed we could feed and clothe the entire population of the world, but under the present state of cultivation, he said we could not previously provide bread for our own population for a single year of famine. He held that a successful system of steam plowing would amply guard against any such contingency as famine, which though not probable, is, at least, possible; further, such a system would add in a great measure to the intrinsic wealth and greatness of our nation. He then referred to that universal law of progress which seems to declare that necessities develop resource, and instanced the steam engine, the telegraph, and other important inventions, as examples of the operations of that law. He held that the course of events points unerringly to the successful steam plow as the next coming revolutionizing invention,—the crowning agricultural consummation of the age.

In the classification of the different plans that have been tried, the gentleman stated that in all, but four principles have been involved. The first and oldest plan embraces all those devices in which driving wheels are used, as in locomotives. This plan, it was stated, had never succeeded on account of great weight, complication, cost, and inability to move over soft or uneven ground. The second class included all those plans in which are used rotary shafts armed with spades, forks, or other digging arrangements, which perform the double office of loosening the soil and propelling the machine. The objections to the first plan applied to this, also, the more fatal objection of the small working capacity claimed for it. The third plan mentioned was that known as the English or Fowler plan, which he said must be admitted possesses considerable merit, as proved by the fact that there are now more than a thousand in permanent use, with the number constantly increasing. Though not meeting the conditions of economy in this country, he stated that no foreign farmer had dispensed with the system mentioned, after having once tried it. This plan in its latest improved form consists of two 20-horse-power locomotive engines, stationed at opposite sides of the field, across which the plows are windlassed back and forth by means of rope wound around pulleys on drums. One engine pays out rope while the other winds up, meanwhile moving along by their locomotive power, as the plowing progresses. It was stated that this apparatus complete, costs in England $8,000. The fourth plan, the invention of Dr. Hall, patented five years ago, was next considered. This consists in a simple portable engine of about 14-horse-power, placed on a common wagon truck, and provided with a set of traction pulleys, between which passes a wire rope, its ends being securely anchored at opposite sides of the field. In whichever direction the steam is let on, the engine moves, drawing itself by its infallible hold upon the rope, and pulling after it a gang of half a dozen or more plows. It was claimed that this apparatus would in a day plow more than can twelve teams of horses, at a saving of two-thirds in current expenses. The estimated cost of this machine was $2,500, including a mile of wire rope. Its many advantages over the English plan were clearly shown by the inventor.

An interesting discussion followed the reading of this paper, and several ideas relating to further improvement in steam plowing were advanced. The meeting then adjourned.

[Written for the Mining and Scientific Press.]

Origin of the Washoe Pan Process.

"Strange it is, such difference be
'Twixt tweedledum and tweedledee."

Editors Press:—It is consoling that the motto of my letter, if not the matter, met Mr. Paul's approval.

Captain Hatch was mining and working silver ores in the State of Sinaloa, Mexico, long before the discovery of silver in Washoe. On his arrival at the latter place, he used substantially the French mill, a modification of the "Boneficio de Cazo," or kettle amalgamation. He substituted iron for the copper-bottomed pan, or kettle of the Mexicans, and iron mullers for the wooden stirrer. These were the only differences in the apparatus. The chemicals were the same as those used by the Mexicans and South Americans for the last 300 years.

Though I claim for him the merit of introduction, I do not claim for him any invention or discovery. Mr. Paul admits that he was "a fine worker of metals," but as he (Mr. P.) tells us that he beat him, it is to be inferred that he himself is a finer.

The Pan, Barba, Kettle, Cazo, Fondon, Cocimieuto, or Washoe pan process, are, with but slight differences in detail, precisely identical in principle, and suitable for the treatment of chlorides, iodides, bromides, iodo-bromides, simple sulphurets, and oxides of silver, and as stated in my letter of the 20th of March, also for native silver, electrum and amalgam. I fail therefore to see anything but a *possibly more convenient arrangement*, that Mr. Paul can lay claim to.

Referring to the remark that all improvements in metallurgy are claimed as either English, French or German, or of some other foreign country, I may observe that I fully endorse Mr. Paul's sentiments. Captain Hatch was an American, and if the credit due to him is claimed for another, let us hope, for consistency's sake, *that he is also* a native born American. J. S.

Tule Growth.—The Pacheco *Gazette* says that a small redwood box was recently dug out from an overlaying surface of more than three feet of tightly-matted tule roots. It is thought that the box could not have remained in the position in which it was found more than eighteen or twenty years at most; and yet during that time that deep bed of tule had formed over it. This fact affords a striking evidence of the rapid accumulation of vegetable matter through the growth of this plant, and points to the probability of an economical care of its growth being made an important aid in the reclamation of overflowed land. A large, if not the principal part of the material entering into the composition of this plant is derived from the carbonic acid of the atmosphere, which, with proper care may be retained in its solid state, to aid in elevating the land above the overflow.

The Sacramento Gas Co. has increased its capital stock from $500,000 to $1,000,000, in shares of $100 each. A dividend ¾ per cent. has been declared. The price of gas in Sacramento is $9 per thousand feet.

Engineering.

Sanitary Engineering.

The influences which climate, water and soil exercise upon human life should be subjects familiar to the civil engineer. Not the builder only, but he who lays out districts, should study them. The subject cannot be agitated too frequently. Dr. Rumsey recently addressed the "Health Department of the National Association for the Promotion of Social Science," and made practical suggestions, which deserve,—says *Engineering*,—"the best consideration of the legislature."

By means of the circulation, every "particle of blood in the body is submitted to the purifying action of the air in 2¼ minutes, according to some physiologists, while, according to others, the time is limited to *half a minute*. Whichever computation be adopted, it is very certain that where the natural conditions of the atmosphere are neglected the blood becomes vitiated, and health deteriorated with great rapidity. Where the air is free to circulate there are 35 parts of carbonic acid gas in 100,000. In towns of any magnitude 80 parts, and in ill-ventilated rooms and work-shops from 100 to 700 parts. But this is not all: where human beings are crowded together the air becomes quickly loaded with organic matter of inconceivable minute forms, a fact confirmed by the recent conclusive experiments made, by order of the War Office, by Professor de Chaumont, M. D., of Netley Hospital, in the prisons and barracks of London. According to M. Lemaire (*Comptes Rendues* October 14, 1867) skin dirt is composed of perspiration, oily matter, and dust. When allowed to accumulate, it is found to contain myriads of microscopic beings, vegetable and animal (*Bacteria* and *Vibrios*), which convey specific germs of disease to the human system. If to these organic particles there be added,—says Dr. Rumsey,—"the pulmonary exhalations of phthisical and scrofulous persons, charged with elements of disease, believed by many to be contagious, we may obtain some clue to a source of atmospheric vitiation in dense populations, of which there is not the faintest popular notion."

It is in vain that our architects exercise their skill in devising modes of ventilation in our houses; for not only is the motion of the air in towns impeded by the proximity and hight of buildings, but the great purifying element (oxygen) being exhausted, it cannot be restored by motion only. The necessity, then, for the introduction of a supply of pure air becomes as obvious as that of pure water, to which the public is at length aroused; and here, we submit, is a problem, the solution of which may well occupy the attention and the skill of our most accomplished civil engineers; while in the valuable discovery of Cavallo, of the power which air, subjected to the electric current (ozone) exercises on organic matter "by resolving organisms into primitive and innocuous forms," we have another question of quite as great importance for our chemists.

The Suez Canal.—In view of the speedy opening of the Suez Canal, various experiments are being made in the part already finished, to ascertain how fast steamers can go in it, and how rapidly sailing vessels can be drawn through it without injury to its sides. The length of the canal is about 110 miles, so that at ten miles per hour, only eleven hours need be occupied in passing from sea to sea. A steamer of 2,000 tons burden is in course of construction at Hartlepool, England, at present, designed to traverse the Baltic in summer, and to run by the Suez Canal to the East Indies in winter. At Newcastle other steamers of 1,400 and 1,500 tons are being built to carry out pit coals and bring back Indian cottons.

Sewerage and the Sea Wall.—In regard to Dr. Stout's charge of a want of provision for sewerage in connection with the new sea wall, the engineer in charge, Mr. Wm. J. Lewis, shows that the Doctor has spoken unadvisedly, and says: "We expect, in coöperation with the owners of property, to present in a short time a water frontage and permanent structures between Montgomery and East streets which will favorably compare with similar improvements in the principal maritime cities of the world."

White Pine Water Works.—The steam pumps, boilers, pipe, and machinery for the Von Schmidt Water Works at White Pine, are being made at various foundries and machine shops in this city, and are nearly ready to be forwarded to their destination. The supply 310 miners inches, or four million gallons a day, at its lowest stage. The water is pumped up through 12 inch pipe, in successive stages. Along this water course are about forty mill sites, some ten or twelve of which, belonging to Mr. Von Schmidt, are located between Treasure Hill and Hamilton; and about thirty, the property of Mr. Perley and others, lying to the southward towards Pocotillo. It is estimated that the works can amply supply fifty mills of twenty stamps each.

A Grand Engineering Scheme.—In December last, General B. S. Roberts, U. S. A., read a paper before the Connecticut Scientific Academy,—says the New York *Times*,—on the Hydraulics of the Continent. "He undertook to show that the system of confining the flood-waters of the Mississippi River in one narrow channel, by dyking, is obstructing the creative laws of delta bottoms and basins, and working the most serious evil by emptying into the Gulf of Mexico the delta-forming material that would, if the waters were left free, spread themselves over the low marshes and swamps, and in time raise them up to higher levels, by the cumulative process of delta deposit, and create cotton lands. He made a very clear demonstration of an easy and economical plan of engineering these dykes by a system of waste weirs, that should create artificial rivers and carry all the flood-waters into the swamps, morasses, bayous, etc., of the Mississippi basin.

He insists that all the flood-waters that come from the great Western tributaries can be controlled and made available to undo the evil that had its beginning with the French and Spanish who commenced this vicious plan of dyking when they owned the States of Louisiana and Florida, and the vast country west of the Mississippi.

After engineering and disposing of the flood-waters of the Mississippi that come from the great Western tributaries, he proposes another plan for engineering the waters of the Lakes, so as to supply at all seasons to the Upper Mississippi, the Illinois and Ohio rivers, enough of their surplus waters to fix a minimum low water navigation. He makes Lake Superior the natural feeder of the Upper Mississippi, and demonstrates the ease with which all the waters that empty out of it down the Sault St. Marie can be canaled into the headwaters of Rum River, and through that channel into the Mississippi, into the falls of St. Anthony. The waters of Lake Huron and Lake Michigan, that are emptied into Lake Erie through the St. Clair River, by deepening the Chicago River, and carrying them in an artificial bed to the head of navigation of the Illinois River. In like manner he would draw from Lake Erie the waters that discharge themselves over the Falls of Niagara, by deepening the Grand River, and from its headwaters cutting an artificial river to the head of the Beaver River, and down that into the Ohio."

Telegraphic.—The Oregon Steam Navigation Company have completed their line of telegraph from Portland to Umatilla on the 31st inst.

The French Atlantic Cable is on board the Great Eastern at Sheerness, and is to be laid in July. The distance from Brest to St. Pierre is 2,325 miles.

Pacific Railroad Bonds.—As an evidence of the confidence which European capitalists are beginning to manifest in the permanence of our institutions, we may instance the fact that the bonds of the Central Pacific Railroad are now being almost exclusively taken up abroad, and on terms far more favorable than the Company has heretofore been able to realize from American capitalists. The bonds of the Union Pacific Road, although not quite so much sought after, are nevertheless being rapidly absorbed in the same quarter. When we reflect that European banks have for years held in their vaults not less than $500,000,000 of idle capital, with no present prospect of any employment for the same in Europe or Asia, this renewed confidence in American securities gives promise of most important results, which, if rightly improved, may be made to aid largely in the development of the varied industrial interests of the Pacific Coast.

Mechanical.

"Blowing off" and "Firing."

Two of the sources of the waste of fuel used in the generation of steam,—or rather, of the waste of heat obtained from that fuel,—are, improper firing and the use of impure water. The *Scientific American* has an article upon the subject, in which the statement is made, that careful experiments made under the supervision of experienced engineers show the loss of fuel caused by the necessary "blowing off," even with good management, to be about 33 per cent. of the total amount used. "In the British navy one-half, or near that quantity, of the total amount of water is extracted from the boilers by means of brine pumps, and although this immense loss of heat is equivalent to nearly three-fourths of the whole consumption of fuel on the grates, it has been found that incrustations of variable thickness will invariably form after a voyage of a few weeks' duration. In the French navy the blow-off is continuous, the water in the boilers being kept at 0.10 of total concentration, so that one-half pound is blown off for every one pound transformed into steam, or one-half pound is blown off for every one and one-half pounds of feed water, corresponding to three degrees (observed while hot) of the standard saturometer adopted by the service. In the Dutch navy the blow-off is effected by hand, periodically, according to the indications of the salinometer, care being taken to allow the water to rise three or four inches above its normal level in the boiler before opening the blow-off cocks."

The only way of avoiding the waste of heat is by using only perfectly pure water. This is secured by the use of condensers, of which there are many forms, most of them, however, open to objections of one kind or another.

The firing of a furnace, although apparently a simple matter, is by no means properly done by all who make it their business. A difference of as much as one-fourth of the amount of fuel used, is perceptible under the management of two different stokers. The following rules for the guidance of such of that class as are willing to learn, are given by W. Wye Williams, C. E., and are quoted in the article aforesaid:

1. Begin to charge the furnace at the bridge end, and keep firing to within a few inches of the dead plate.
2. Never allow the fire to be so low before a fresh charge is thrown in that there shall not be at least four or five inches of clear, incandescent fuel on the bars, and equally spread over the whole.
3. Keep the bars constantly and equally covered, particularly at the sides and bridge end, where the fuel burns away most rapidly.
4. If the fuel burns unequally, or into holes, it must be leveled and the vacant spaces filled.
5. The large coals must be broken into pieces not bigger than a man's fist.
6. Where the ash-pit is shallow it must be frequently cleared out. A body of hot cinders overheat and burn the bars.

Liquid Fuel in France.—An American who signs himself "H. H. H.," writes from Paris to the *Scientific American*, describing a practical test recently witnessed by him in that city, of the working of an American invention for the use of liquid fuel in steam making. The engine was of 15-horse power. The fuel used was "the refuse of oil," at the rate of two gallons per hour. Its cost was three cents per gallon, say $7 per ton. A ton of coal,—he says,—will occupy 44 cubic feet; liquid fuel only 33,—and the latter will evaporate more than twice as much water as the former. The labor required is moreover only about one-tenth that necessary for managing a coal fire. "After several hours running, it was found that the ratio of oil consumed, to the evaporation obtained, had diminished to about one-half the amount used at first.

The writer says that capitalists have bought the patent for several European countries, at a high figure. The inventor considers the plans specially applicable to metallurgical processes, and has designed and patented furnaces for such processes which are calculated for the use of liquid fuel. The scientific and practical gentlemen who were present at the trial, unanimously gave it as their opinion that the use of liquid hydrocarbon as a fuel was a "success."

The Epicycloidal Engine.—The London *Mining Journal* reports a paper read by Mr. Laird, at a recent meeting of the London Association of Foremen Engineers, entitled "The Epicycloidal Engine; an Effort towards Improved Screw Propulsion." "The modern short-stroke horizontal screw engine," said Mr. Laird, "owes its shortcomings to the desire to pack the whole machine in the smallest possible compass. That engine, however, is the best which, with a given total length, has the longest connecting-rod. The disadvantages of the short connecting-rod may be comprehended as thus: 1st, Increased friction produced by the augmentated rubbing pressure of the guide pieces; 2d, a certain amount of increased friction on the joint-pin between the piston and connecting-rod; 3d, increased friction at the crank-shaft bearings due to the alternate lift and down pressure upon the shaft; 4th, and most important of all perhaps, the irregularity of motion induced by two violent pressures succeeding each other at short intervals, and the long pause intervening when the force is very small. In the epicycloidal engine two cylinders of rather unusual length are placed on either side, and parallel to the screw shaft. To the ends of the piston-rods guide-blocks or slippers are keyed, or otherwise secured. Two pins pass through the blocks, and these carry friction rollers with V edges. The rollers work into epicycloidal grooves, cut on the circumference of a barrel, and thus communicate to the latter a rotary motion. The barrel communicates motion to the screw-shaft and propeller. The object is to create on the face of the barrel such a curve as would give the action of the crank transmitted to the travel of the piston. In order to obtain this end the circumference of the barrel was divided into a given number of parts (say) 12, and half its length into 144, or the square of 12. Then, starting from the middle with 2 on the circumference, and drawing a line to 4 on the half length—from 3 to 9, 4 to 16, 5 to 25, and so on till reaching 12 to 144—a geometrical curve. The alternate action of the friction rollers into the groove give the required rotary motion."

Casting Iron Pipes.—An exchange gives the following French method: "The boxes for casting the tubes are set up on end, in a semi-circle, around a crane that commands the whole of them, and consists of two semi-cylindrical jointed portions connected by pins. At their lower end is a valve, serving to close the tube, while a conical depression in the middle receives the spindle of the pattern and of the core, exactly centering them. Tubes of different sizes are provided, so that there need not be more than one and a half or two inches space between the pattern and the walls, and the labor of stamping is thus diminished. Small apertures in the tubes permit the escape of the gases. The mold is made in the usual manner, the patterns being of smooth and polished iron, and turned round once on the axis, before being withdrawn, by means of the crane. Heated gas is then admitted from the furnace into and through the tube until the sand is perfectly dry, which takes from one to two hours. The core is then inserted, and the casting effected. The connect between the furnace and the casting tube is established by means of a slide or valve."

Fire-Proof Flooring.—A new French plan for making the floors of warehouses fire-proof, consists in first spreading upon the planks a layer of clay about an inch in thickness, and running upon this a layer of asphalt about half an inch thick. Numerous experiments, it is stated, have proved the efficacy of this as a protection against the spread of fire, and it has been adopted in all the corn stores of the General Omnibus Company of Paris.

Varnish for Artists.—A good varnish for mechanical and architectural drawings, maps, etc., is obtained by dissolving in one gallon of alcohol one pound of white shellac, one-quarter of a pound of camphor, and two ounces of balsam fir. This varnish dries rapidly, and has been successfully used by experienced artists.

Scientific Miscellany.

Transpiration of Gases.—*The Engineer* reports a lecture delivered on January 30th, at the Royal Institution, by Dr. Odling. He said that in the passage of gases through capilliary tubes, the same quantity of any one gas will pass in the same time, all the conditions being equal, whatever may be the material of the tube; probably because the sides of the tube are lined with a still layer of the gas, so that the moving portion does not touch them. "Each gas has its own rate of transpiration, hydrogen traveling through the orifices much more rapidly than oxygen. If the two gases be mixed, the rate of transpiration will not be that of the mean between the two gases, but the rapid hydrogen will impress its rate upon the slow oxygen, a fact at present which is quite inexplicable. When the capillary tubes are very small indeed, gases diffuse through them at entirely different rates, which rates are inversely as the square roots of the specific gravity of the gases. When hydrogen diffuses into air, it travels at the same relative rate as into a vacuum, but not at the same real rate; whenever one gas diffuses into another, there is reciprocal action; and when four parts of hydrogen diffuse into air, one part of air will diffuse into hydrogen, so that there is an effective pull of three volumes of hydrogen. To show this diffusion, Dr. Odling took six long clay tobacco-pipe stems, and connected them together at the ends with joints of black india-rubber tubing. He then decomposed water in a flask, by means of an electrical current, and allowed the explosive mixture of oxygen and hydrogen to pass along the bore of the pipes. The hydrogen all diffused out through the substance of the clay, whilst one-fourth its bulk of common air diffused inwards. Nothing, therefore, was delivered at the further end of the pipes but a non-explosive mixture of oxygen and common air. He then held up a long glass tube with a bulb at the end, and asked the listeners to assume the globe to be a cell of the lungs, which, in expanding and contracting, causes air to flow backwards and forwards through the tube. This explains the mechanical action of the lungs, and it is believed that they take up oxygen from the air by diffusion. Ether will diffuse more rapidly into hydrogen than into air. Gases will also pass through other than capillary and porous septa; they will pass through cold, soft, colloid substances, such as india-rubber, albumen, and some of the metals, but the rate of passage is again altogether different."

Auriferous Rocks in Southeastern Africa.—This was the subject of a paper read at a meeting of the Geological Society of London, January 27th, by Sir R. I. Murchison. We find it reported in the London *Mining Journal*. The author of the paper was Dr. Sutherland, who, fourteen years ago, expressed the opinion that gold would be found in the metamorphic rocks of Natal. A few months since Mr. Parsons found this metal by washing the iron-sand of some of the southern rivers of the colony. The gold is in microscopic rounded grains. Dr. Sutherland considers that the gold is diffused as minute particles in the granite and gneiss underlying the Silurian rocks of South Africa. These old gneissic rocks are much contorted, include extensive veins and lenticular masses of quartz, and are traversed by basalts. The Silurian strata, resting unconformably on the gneiss, have been invaded by igneous matter (which is never granitic), and though generally horizontal, are frequently flexuous, and in some places greatly faulted, to the extent of even 1,000 feet, together with the gneissic rocks beneath. These latter have been deeply eroded by the rivers, frequently to the depth of 500, 1,000, and even of 3,000 feet in some valleys; and in the alluvia of these valleys gold occurs. The valleys have sometime evidently commenced in great displacements, forming "valleys of elevation," on which the denuding agency has been operating ever since. In certain mountains in the basin of the St. John's River, Natal, dioritic rock traverses the secondary strata; and along the line of contact it contains copper ores, with 100 grains of gold to the ton.

Mr. David Forbes was glad to find that Dr. Sutherland corroborated his views as to the occurrence of gold in two ways:

1. In auriferous granite, as in Wicklow and elsewhere.
2. In eruptive diorite, a basic rock without free quartz, and certainly of post-oolitic date, almost always accompanied by copper veins. Most California alluvial deposits of gold were derived from this class of rocks.

In constructing some of the railways of South America the granite was found to be so soft, from decomposition, that it could be cut with the pick and spade, and this softened granite when washed produced gold.

Professor T. Rupert Jones considered that, by means of Dr. Sutherland's communication, the Laurentian and Silurian rocks were now, for the first time, to be recognized as existing beneath the *Dicynodon* rocks of the Natal ridge.

The Himalayas.—Robert Von Schlagentweit, one of three brothers from Munich, who have been traveling in the East for the last fourteen years, recently lectured at Steinway Hall, New York. He had just concluded a course of eleven lectures before the Lowell Institute at Boston. The brothers traveled separately and in disguise, having only occasional meetings, months apart, previously agreed upon. The lecturer was listened to at Steinway Hall with great interest as he described the charming Sprinagor, with its artificial islands and swimming gardens,—its exquisitely beautiful women and its symmetrical men. "Here also grows the veodara, which appears as if covered with gold dust, which, with the sun shining upon it, looks truly gorgeous." The lecturer described,—saye the *Tribune*,—"the wonderful effect of the sudden transition from rich vegetation to snow-clad mountains, of which 216 had already been measured, 17 of which measured 25,000 feet, 40 over 23,000 feet, and 120 over 20,000 feet, while the much-renowned Mt. Blanco measures only 15,784 feet. The Gaurisankar or Mt. Everest measures 29,002 feet; the next highest mountain in the Himalayas is the Kanihiniinca, reaching the bight of 28,156 feet, or 2,000 feet more than the famous Dhovalaghiri."

The Solar Prominences.—Professor Alexander Herschel, of Glasgow, recently lectured upon this subject. He said that the theory of M. Faye as to the constitution of the sun was very difficult to be shaken, and was the one generally received; viz., that the sun is purely gaseous in its nature, and is composed of substances volatilized by the intensity of the heat: "Incandescent solid or liquid matter always gives a continuous spectrum, but the light of the sun shows a spectrum which, though nearly continuous, is cut here and there by fine dark lines. Such effects can be produced on earth by placing an absorbing gas between the spectroscope and a white-hot body emitting the light under examination. Hence it is believed that the white-hot particles in the sun float in and are covered by a gaseous atmosphere. That the solar prominences are gaseous in their nature, was proved by the spectroscopic observations of the last eclipse, and although the observers vary in their accounts of the lines they observed, all tend to show that burning hydrogen is very plentiful outside the more luminous photosphere of the sun. The largest promineuce of blazing gas seen during the eclipse was about 90,000 miles high."

Speed of Signaling through Cables. The "speed of signaling" through a telegraph cable varies,—other things being equal,—as the square of the uninterrupted length. That is to say, if a cable were divided into two equal parts, the speed of signaling through either would be four times as great as through the entire cable in one piece. So the gain in speed by dividing a cable into parts would be in proportion to the number of those parts.

Early American Maps.—Rev. D. L. Woods, late President of Bowdoin College, secured reduced copies of thirty-two early maps relating to the discoveries on the northeastern coast of America, during the first half of the 16th century. They are soon to be reproduced among the collections of the Maine Historical Society. He discovered also a manuscript of Richard Hakluyt, drawn up at the request of Sir Walter Raleigh, in 1584, giving an account of the results of the "Western Discoveries lately attempted."—*Am. Journal Sci. and Arts.*

White Pine Summary.

VEINS UNDER CHLORIDE FLAT.

In the Charles & Teresa mine, an old location, for a thousand feet on "the ledge," Captain Mallett has struck not only $10,000 ore, but a vein; at the lowest workings three feet in width, in regular casing, and dipping to the west at an angle of between twenty-five and thirty degrees. The vein is of quartz, and spar, and is well filled with horn silver, the latter appearing in broad scales wherever a mass of ore breaks, seeming to permeate every portion of it. The appearance of the rock at the lowest depth reached, indicates—says the White Pine *News*—a regular system of veins running through Chloride Flat.

NAMES.

There are so many mines of nearly or quite the same name at White Pine, that the personal names of owners are coming into favor as the best means of avoiding confusion.

ANTIMONIAL SULPHURETS.—The St. Lawrence ledge, near Hamilton, shows beautiful ruby silver, in quartz. The *News* mentions especially several rich specimens, as beautiful as the rarest ever obtained at Austin.

FISSURES LINED WITH SPAR.—One of the characteristics of Treasure Hill is that these are frequently traced to a connection with chloride deposits. The Canton shaft, for example, followed a fissure of this kind to a depth of 115 feet and struck rich chloride ore. Whether these fissures are continuous cracks, or mere cavernous openings caused by the well known, and frequently observed dissolving influences of water upon limestone, appears to be very imperfectly determined. Some of the larger chloride bodies are very possibly re-fillings of such openings, where the limestone for some reason or other was more easily dissolved out than elsewhere. The spar following the fissure, being nothing but limestone, was deposited there very probably by the same solutions that deposited either the quartz or the chlorides, or that metamorphosed the latter from sulphurets. It is nothing astonishing or novel therefore to find that there is frequently a connection between them, for both seem to have traveled the same road. But if quartz and lime accompany silver, it is yet not safe, as we know, to conclude that the reverse is inevitably true—that silver accompanies either quartz or spar wherever they occur in metalliferous regions.

CASES OF SHARP PRACTICE, may, in the excitements that steep Treasure Hill, be overlooked, after a few days, in that vicinity, on the prineiple that "might is right," and the successful money-catchers be encouraged by all the world to hold their heads aloft. But at this distance from Treasure Hill the attempts of Brandow and of the honest minor, (we are sorry that our imperfect memory prevents us from doing justice to his name,) to obtain a look even less commendable than the raids of our enterprising burglars and highway robbers in San Francisco. A successful burglar may enjoy the satisfaction of getting away with his spoil and his neighbors' not being the wiser of it. But a mining sharp is sure to be found out at the very instant that he pockets his gain; and tricks like those referred to must cause the rogues a fine sensation in the act of being caught.

INDEFINITE REPORTS of newly discovered rich districts, "eighty miles southeast" of here or there, circulate so plentifully in the silver regions, and there is so little to them ordinarily, that justice cannot be done in making much notice of them at the present time. Silver and copper of course exist, nearly everywhere, in traces; the additions to this fact, as detailed in the reports, varying to a considerable extent, as the imaginative capacity of the observers. Their effect, however, will be to develop, in the end, substantial deposits in more than one good locality besides White Pine.

Before the Summer is ended, says the Reese River *Reveille*, there will be no place on the map of the region between the Wasatch and the Sierra Nevada that can properly be marked as "unexplored regions," but in these blank spaces may be towns and cities, with all the busy life of prosperous communities. This is possible, and from facts lately come to light, is more than probable. Few would have thought one year ago that upon this lofty, rocky peak would be built a city of six thousand inhabitants, which at this time would become famous throughout the world. Now every barren rock will be examined, and none so precipitous, snow-covered, or cloud-capped will repel the silver hunter.

ABOUT THE DIAMOND RIDGE.—The most important developments yet made in the Diamond range are in the Eureka district, where the ore occurs under conditions similar to that of White Pine. It exists chiefly in the form of deposits in limestone, and the ore produced in many of the claims is of a high grade. Experiments have shown that much of the ore may be treated successfully by smelting, and a company is now engaged in building a furnace for the purpose, which will be completed this month. There appears to be no doubt of the success of these smelting works, and when it is known Eureka will receive a share of the attention now concentrated on White Pine. Besides the smelting ores, others suited to the process of amalgamation are said to exist in abundance, and several tons have been worked at the Manhattan mill in this city which yielded handsomely of silver. The slight explorations of prospectors encourage the belief that the Diamond range is highly metalliferous.—*Reveille, March 15th.*

THE WEATHER during the last days of March was fine at Hamilton, says the telegraph, with northerly winds and passing clouds; thermometer 60° during the day, below freezing at night. Streets bare. At Treasure City, and on Treasure Hill, the snow was melting very slowly, but on the 30th and 31st there came another snow storm,—snow in the mountains but rain principally in the valleys,—which stopped the stages, and treated passengers who generally went on "footing it," to an old style rough time, there being six inches of snow in Ruby valley. To imagine it is enough for us.

POPULATION, HOUSES, ETC.—We are told by different correspondents that more work is to be found by new comers, at present in connection with building, than mining, about Treasure Hill. Before July 40,000 people are counted upon, that will have to be housed somewhere in the district. Employment is promised to at least 20,000 miners and millmen. In Treasure City the lower side of Main street is built up solid for half a mile in length, with one story and quite often two story houses, which are devoted to merchandizing and saloons; the upper side of Main street, we are told, "is devoted principally to what the old French chroniclers call "*La noblesse de robe*," that is to say, the gentlemen of the law,"—who are surely in force enough to secure justice to everybody that may deem that he has a right to be rich, and who finds himself left in the lurch by an unjust world. Accommodations still fall far short of the demand, and as lumber enough cannot be had, even carpenters by the score are said to be lying idle; the local sawmills being of but small capacity and entirely unable to supply the demand made on them by the towns of Treasure City, Hamilton, Silver Springs, Eberhardt, White Pine City, Swansea, Babylon, Pocotillo, etc. Streets and grades are not yet established. Wells, Fargo & Co., in connection with the Bank of California, have purchased two lots on the west side of Main street, near Virginia street, and will build thereon a fire-proof building of stone, having forty-six feet front, with a depth of sixty feet.

A private letter states that a number of persons have left White Pine to get work on the railroad. * * The *Daily Inland Empire*, published by Ayers and Putnam, formerly of Virginia City, has made its appearance. * * That part of Lander county in which White Pine is at present situated, says the *Reveille* of March 25th, appears to be exceedingly insalubrious to "witnesses." In the return of the Deputy Sheriff made to the District Court that morning there were affidavits from three physicians, and a certificate from the fourth setting forth that the persons subpœned were too sick to "travel to Austin." * * Three stages containing some 27 passengers for White Pine, nearly all old miners and prospectors, left Virginia City on the 22d. Letters received there at present are said to be about half and half as to the prospects in paradise. * * During the last week Hamilton presented a scene of life and business not often witnessed in older cities. The street in front of the offices of Wells, Fargo & Co. and the Pacific Union Co. has been almost entirely blockaded with goods of all kinds. * * During the month of March, up to the 27th, bullion to the amount of $42,994.22 was shipped from the express office of Wells, Fargo & Co. During the preceeding week the Pacific Union Express Co. shipped from their office, 38 bars of bullion, weighing 3,864 pounds, and valued at $63,599. * * The Board of Brokers, at Treasure City, is not yet fully under way. The number of members is limited to 50. A regular member's seat commands a premium of $200. No quotations are yet reported.

ELKO OF TO-DAY.—There are some ninety tents and three or four board houses in Elko. There are about forty places where whisky is sold, some ten places where general merchandise is sold, one drug store, two butcher shops, some dozen lodging tents, two harness and two blacksmith shops, a good many apple and peanut stands, one place of general trade, kept by Kate Forrest, and one hurdy-gurdy house. Mr. Erlanger says there is no work being done in Elko except the putting up of a tent occasionally, though considerable preparation is being made to commence farming in the country adjacent.—*Enterprise.*

MINING AND MILLING.—The California mine, says the telegraphist to the *Bulletin*, bids fair to rival the Eberhardt. * * The Katie lode near the toll house on the road to Shermantown, is four feet in thickness, and has the appearance of being a true fissure vein. Quite a number of very fine appearing veins have been found in that vicinity lately, and the locality is rising into high favor with the prospectors, says the White Pine *News*. * * At Shermantown two mills—the Oasis and Moore & Borker's—are steadily at work on a full supply of ore from the mines of the Eberhardt Co. The first mill is running on ore producing $600 per ton, and the other on ore of a lower grade, producing only at the rate of $250 per ton. Sixteen tons per diem are reduced, producing in the aggregate, $7,000 daily. * * Extensive contracts have been let for doing work in the Florida mine and on the mines of the Manhattan Co. * * The Happy Jack vein carries metal throughout, and range, from $136 to over $900 per ton. It is estimated that the entire mass will work near $900 per ton. * * The Phœnix mine has been further developed and now shows a breast of splendid ore, between well defined walls of from twenty to thirty feet. It is located near the Peter Rice toll road, about a quarter of a mile from Hamilton, and is said to be the most promising ledge on that side of Treasure Hill. The company are taking out several tons of ore daily, which it is estimated will mill from $200 to $500 per ton. * * The Wheeler mine, beyond the small pox hospital from Hamilton, is in a vein containing plentifully the black sulphurets of silver, which the editor of the *Inland Empire* traces from the well-defined croppings observable near the northern base of Treasure Hill, by way of the Virginia, Parker, Phœnix and Featherstone mines; forming quite a list of valuable mines in the vicinity of Hamilton, to which the Maggie, Donnelly and others might be added.

PROSPECTING AND NEW DEVELOPMENTS.—Mr. James Basey has explored several mountain ranges lying between the White Pine and Eagan ranges, and found mineral, but is not satisfied with the prospects obtained. In Patterson district he found about 100 men engaged in prospecting. A large number of very promising veins have been found, the most valuable appearing to be the Grey Eagle and the Peek, which show a width of about six feet, and crop out for a distance of three or four thousand feet. About three miles north of the Grey Eagle are the Curtis and McClure ledges, which are very wide and assay $95. * * Judge Lindsley and four other gentlemen left Shermantown on the 25th instant, for the purpose of examining the mines of Grant, Troy and Reveille districts. * * The Black Eagle ledge, located six weeks ago, in the Spring Mountains, 7 miles north of Hamilton, has developed a rich deposit of a gold and silver ore, the gold largely predominating—some of the rock being literally spangled with the precious metal. The lode is represented to be from 20 to 40 feet wide, the pay streak being about two feet in width and running along the north side of the ledge. * * Valuable discoveries have recently been made about 40 miles from Treasure City, in a direction a little north of east, in a new district called the Robinson. The ledges are large and well defined, assays running from $100 to $500 to the ton in croppings, and some selected specimens going as high as $1,500. Large timber and good wood is abundant. Messrs. Lamb, Russell and Hicks, old Virginia City men, have bought Robinson's ranch for a town site, at a cost of $6,000 coin, and have also located a toll road from the new diggings to Egan Cañon, the nearest settlement. * * On the 17th instant "Cave District" was organized in the range of mountains which contain the great Mormon cave. The country rock is limestone, and six large veins of metalliferous quartz pass through it. Two of these, the Homestake and Lizzie's Potosi, show ore of great richness, the species being stettefeldtite, which was found so plentifully in the croppings of the Highbridge, at Silver Bend. The district abounds in timber and water, and is surrounded by a good agricultural country.

British Letters Patent.

The attention of Pacific Coast Patentees and inventors is invited to the annexed abridgement of the Laws and Regulations relating to patents in this country:

The invention must be new in the kingdom, but may have been used and published abroad at the date of application. An invention patented in America may be secured at any time during the life of such prior patent. The application must be limited to one invention. The invention must be useful to support a patent, and there is a *nominal* investigation of its merits, by the law officer—Attorney or Solicitor General.

The actual inventor or first importer—a native or foreigner—and the resident legal representative of a deceased applicant, may become a patentee. The first importer or communicator need not be the actual inventor, or even meritoriously connected with the invention. There is generally no remedy for the actual foreign inventor who has been anticipated in his application by a first importer or communicator. A joint inventor cannot secure a patent in his own name, but may, when residing abroad, singly communicate the invention. A minor or married woman may secure a patent. It is for many reasons advisable to secure British patents in the name of a resident agent.

The first stage of a patent is "provisional protection." The invention is protected from date of application. To complete the patent, "notice to proceed" must be given within four months, "warrant and seal" be applied for within five and a half, and "complete specification" filed within six months when not lodged with the petition. The application may be abandoned at any stage. The invention may be worked and negotiated under the "provisional protection," but an assignment cannot be recorded or properly made before the issue of the patent. The grant of the patent may be opposed within three weeks of the publication of "notice to proceed." The patent *may* be completed two months from first application. A limited extension of time may be obtained for taking the several steps when failure has arisen from accident or death of applicant. No model or specimen can be deposited. No patent of addition is granted, but disclaimers are allowed, and a duplicate patent, in case of the loss of the original, may be obtained. The patent is granted for fourteen years, but expires with a prior foreign patent. An extension, not exceeding fourteen years, is sometimes granted, or the patent may be annulled for good reasons. A stamp duty is payable at the end of the third and seventh years of the patent. The patent-right does not extend to the Colonies. An assignment, to convey the title, must be recorded. The patented invention may be freely imported, subject to the revenue laws. Either joint patentee may make and sell the patented article for his sole benefit. The law does not require the invention to be worked. The patent right extends throughout Great Britain, Ireland and Scotland.

DEWEY & CO.,
American and Foreign Patent Agents, Mining and Scientific Press Office, No. 414 Clay street, San Francisco.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, April 3, 1869.

Financial.

Our local money market does not exhibit so much plethora as at the date of our last issue. The demand for money has been unusually active for some days past. Delays and obstacles to the regular transmission of mails have caused the necessity for duplicate remittances eastward, in order that they might reach their destination in time. Very large drafts have been made upon our cash supplies for mining and real estate operations, nevertheless our market works steadily and with unchanged rates. The business done by our savings and loan societies in the way of advances upon real estate and cancellation of mortgages is heavier than at any previous period, and though their cash balances are remarkably large, loans of the kinds named readily command 1 per cent. per month. Bank rates rule steady at 1@1½ per cent. monthly, exceptional paper being done at 1½ per cent.

Business is improving, and shows signs of sprightly activity at an early day. Our wheat crop — much the largest ever seeded in the State—is now considered as being fully assured, the plant being sufficiently high to shelter the roots and prevent the moisture from going off by solar evaporation. Moth, mildew and rust are scarcely known in this State, and the only enemies we have any reasonable cause to dread are blighting northers and the chance of conflagrations in the ripened fields. The former are not likely to occur after the vernal equinox, and the ground is thoroughly saturated by late copious rains. The wheat yield for 1869 is estimated at upwards of ten millions of centals.

City Stocks.

During the week under review we note sales of San Francisco Gas stock at $77 per share, and North Beach and Mission Railroad at $72 25. The usual monthly dividends are announced by the following incorporations: San Francisco Gas Co., Spring Valley Water Co., and Sacramento Gas Co. The latter company increased its capital stock from $500,000 to $1,000,000, divided into 10,000 shares of $100 each. In connection with the State Telegraph Co. dividend announced in our issue of the 20th of March, we stated that the last previous dividend was paid in July, 1868, whereas the *last* previous dividend was paid to stockholders in November of that year. The Pacific Bank and Merchants' Mutual Marine Insurance Co. also announce their usual dividends for the present month. At the close, we note sales of San Francisco Gas stock at $77 50, and one share of California Steam Navigation Co. at 71 per cent. The North Beach and Mission Railroad Co. disbursed their usual monthly dividend on the first instant, having changed their dividend day from the 15th to the 1st of the month.

Mining Share Market.

Since our last issue the market for mining stocks has been somewhat irregular, and prices, as a general thing, are less firm than at the opening of the week; however, several prominent claims have appreciated considerably in view, no doubt, of approaching dividends during the present month.

From our carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following interesting figures for the first three months in 1866, 1867, 1868 and 1869:

MONTH.	1866.	1867.	1868.	1869.
January....	$2,727,187	$3,664,322	$8,698,934	$7,964,134
February...	3,752,292	3,303,520	9,716,596	6,818,644
March.....	5,299,084	4,031,289	11,471,830	6,954,145
Totals....	$11,778,563	$11,002,131	$29,887,360	$21,737,523

White Pine becomes more and more fascinating, as the time approaches when prospecting can be conveniently carried on. It is affirmed that the mineral belt is very extensive, stretching away to the southeast of Treasure Hill, and that the ore is remarkably rich. It needs to be extensive, to give room for the 170 companies organized to carry on mining operations in that district. The amount of capital represented by these companies is about $250,000,000, and it is said that over $100,000,000 more will be "stocked" in the same business from the East. In March alone, there were 80 new companies incorporated in this city, nine of them being incorporated in one day. Should this furor continue, and there are no evidences of a decline yet, the amount of money represented in White Pine companies will reach to $400,000,000 by the end of June next. We know too little about the facts yet to separate "wild cats" from good claims; but there will be a terrible commotion some day not very remote.

GOULD & CURRY—sold within a range of $98@119 in January, $103@110 in February, and $100@118 in March. We again make copious extracts from a correspondent to the *Daily Herald*. Concerning the Gould & Curry mine he says: In its hey day of prosperity was the most famous of all the silver mining companies of this district, the lode being wider and the amount of rich ore larger than in any other claim. Even now the old levels yield considerable quantities of pay rock, which was passed by as unprofitable in the days of high milling charges. The present prospecting work is being done through the Bonner shaft on D street, which has been sunk to the depth of 1,140 feet. About six weeks ago the shaft caved, caused, perhaps, by a little carelessness in the retimbering to put it in proper working order for the pump, guides, etc., preparatory to drifting at that level. The shaft has since been put in proper shape, and work was resumed in the bottom some ten days ago, and sinking for a sump commenced with very fair prospects. Quartz, carrying considerable metal, has been extracted, as the work has been prosecuted to greater depth. Unfortunately, a few days since, they broke their spur wheel shaft, requiring four days and nights to repair, and, in consequence, the shaft filled with water to the height of about 300 feet. The hoisting and pumping machinery are now in good running order, and the water in the shaft is being reduced at the rate of about forty feet in twenty-four hours. It is proposed to sink about twenty feet deeper, for the purpose of a sump. When that is done the drifting from that level will be commenced, west through the lead, and north and south upon it. I call it a lead, because every indication shows conclusively that it is one or, at least, what some term the east body of ore, from which the Savage and Hale & Norcross have been extracting a large amount of pay rock since the suit with the Mitchell Company in 1867, and from which they are still taking immense quantities. The 1,140 level or bottom of the shaft is about 300 feet lower than the Savage sixth station, and the Savage sixth station is about 200 feet higher than the Hale & Norcross fifth station. Those are the working levels, at present, of the Savage and Hale & Norcross. The Savage Company are now sinking for their seventh station, which will probably be opened in the course of two months, as they are now down between seventy and eighty feet. Should the Gould & Curry find, as is confidently hoped, as rich a body of ore as has been struck in the claims immediately south, it will prove of great advantage in reviving the spirits of stockholders in many of the claims which as yet have unsuccessfully searched for the missing lode at the present depths. From what is called the old mine, some forty to sixty tons of fair milling ore, averaging from $18 to $28, is now being extracted daily.

SAVAGE—was largely dealt in during the past quarter, selling at $75 50@87 50 in January, $80 50@73 in February, and $64@79 in March. "This claim—800 feet—adjoins the Gould & Curry on the south. Their present works are situated a little east and south of the Bonner shaft. They are extracting over 200 tons of ore daily, of a very good quality, milling from $35 to $40, averaged. The larger portion of it is being taken from what is called the Potosi chimney. The breast at that point, which is on the third station, is from thirty to forty feet wide. It is said that the winze from the third to the fourth station is looking very promising. The extent of this body of ore is not known, but there are no indications of it 'petering' at present. A considerable amount of ore is also being taken from the old, or west works. On the sixth station, in the north mine, a few days since they struck a formation similar in character to the body of ore found in the Potosi chimney, on the third station. But as yet it has not been sufficiently developed to demonstrate fully whether it is a continuation of that body or not. Some portions of the shaft having been sunk through swelling ground, it has been a matter of considerable trouble and difficulty to keep it in good working condition. Below the sixth station, however, the ground is harder and of a much more favorable character, greatly facilitating the work of sinking. From all appearances this mine is being worked for the benefit of the stockholders, and not, as some other valuable claims here are, apparently for the advantage of the mills alone."

HALE & NORCROSS—changed hands to a very large extent during the past three months, selling within a range of $44 50@70 per share in January, $61@98 in February, and $77 @98 in March. The fourth station level of this mine produces a large quantity, and on the fifth level the ore is now two and a half feet wide, appearing regular in its formation. The breasts on the 175 level are reported to look well, and work done by the Chollar company below this level adjoining this claim (Bajazette ground) shows a body of good ore 18 feet wide as far down as has been worked—about 55 feet. The Hale & Norcross company are opening the 300 level, in order to take out this body of ore to greater advantage. To this date the March receipts of bullion aggregate $14,840.

KENTUCK—has also been active during the first quarter of the present year, selling as high as $263 in January, falling to $200 in February, and rising to $385 in March. The bullion returns, so far, on March account, foot up $52,461. Rumor has it that a handsome dividend will be disbursed the present month.

CHOLLAR-POTOSI—sold at $158@137 50 as extremes during the month of January, $160@171 in February, and $157@180 in March. During the week ending March 26th, 740 tons of ore were extracted, of which the new tunnel stope yielded 80 tons. In the new shaft the rock is said to work easier, but nothing of an encouraging nature has yet been encountered. This mine is yielding at the rate of 120 tons per day. The Secretary's office has been removed to 19 Hayward's Building, California street.

IMPERIAL—ruled at $100@149 in January, $104@149 50 in February, and at $82 50@199 50 in March. To the 27th ult., the bullion receipts for the month of March aggregate $17,008. The lower drift—1,100 level—is still obstructed, and work delayed.

CROWN POINT—has been quite active during the past three months, selling at $52 50@70 in January, $65 50@73 75 in February, and $70@80 in March. The shaft is at present being repaired, which will take about a week to finish. Commenced drifting from the 1,000 level, and it is believed they will cut the vein simultaneously with the drift from the 1,100 station.

OPHIR—has been watched with great anxiety during the past few months, and considerable stock changed hands, selling within a range of $33@39 in January, $39@45 in February, and $29 50@40 in March. The face of the west drift in the new shaft is reported to look better, the rock being more sunny. The drift has attained a distance of over 130 feet.

OCCIDENTAL—gained considerable prominence during the first quarter of the present year, selling during the month of January at $21@31 as extremes, in February at $27@33, and in March at $26 50@35. A correspondent writes that the ore in the winze continues to improve; in fact, the whole south mine shows better prospects than ever. The lower tunnel is being steadily driven on, and the face is now dry. About ninety tons of ore per day are now being shipped to the mill, where it is the intention to accumulate 1,000 tons, in anticipation of more stormy weather, and consequent bad roads. A dividend will certainly be paid this month.

SIERRA NEVADA—is in good request, having greatly appreciated in price during the month of March. In January sales were made within a range of $25@32, in February at $21@30, and in March at $27 50@48. This claim has lately been yielding increased quantities of ore, showing quite a large production of bullion. It is stated that a drift will shortly be run to the southeast, from the 700 level, with the expectation of cutting the east vein found in the Savage and Hale & Norcross claims.

MAMMOTH (White Pine), placed on the Board list during the past week, sold at $10 per share. The claim consists of 1,800 feet, divided into 20 shares to the foot at a par valuation of $100 per share. PHŒNIX (White Pine) sold at $4@6 per share. The FLOWERY Mining Co. (Washoe) recently elected the following Trustees: A. K. P. Harmon, President; J. H. Jones, Vice-President; A. H. Barker, Charles Hosmer and M. J. McDonald. T. W. Fenn was appointed Secretary and O. S. Carville, Superintendent. This stock sold during the week at $5@6 per share.

A CANARD.—"Pure liquors for medicinal purposes sold here." This sentence is conspicuously exhibited in the store windows and on the signboards of many spirit merchants, druggists and general dealers. The information it imparts would be invaluable if true, but unfortunately it is not. All the liquors of trade, foreign and domestic, are more or less adulterated. If a stimulant is needed in the hospital or the sick room, prudence dictates the selection of an article absolutely free from every deleterious element. There is only one such article in the market—"Drake's Plantation Bitters." The spirits of which they are in part composed is not an ordinary commercial staple, but a wholesome, rich, thoroughly rectified liquor, distilled from the sugar-cane for the proprietors of the Bitters by their own employees, on their own plantations in St. Thomas, and not to be obtained at any price from any other source. ***

Particular attention will be given to preparing engravings, inserting advertisements in conspicuous, novel and attractive form; we will otherwise assist advertisers in getting up their notices, when desired.

☞All advertisements in the PRESS appear in both the ☞MONTHLY AND QUARTERLY SERIES of the MINING AND ☞SCIENTIFIC PRESS, which (by special arrangement) are placed for FREE READING in the principal hotels, steamboat and steamship saloons, depots, and public libraries in San Francisco, and the Pacific States. Many ☞volumes are also bound, thus affording permanent advertising.

The PRESS now receives the largest and best advertising patronage of ANY WEEKLY PAPER west of the Rocky Mountains.

In regard to the value of advertising in our journal, we refer with pleasure to those who can speak from experience—*our advertisers*. Better referees, or more reliable names, cannot be found in the advertising columns of any newspaper in the world.. **DEWEY & CO.,**

Publishers and Patent Agents.

San Francisco, March 1, 1869.

SHIRTS.—Somebody has made the calculation that every shirt ultimately brings to the washerwoman twice as much as is realized by the producer of the cotton, the spinner and weaver of the cloth, and the maker of the shirt, all told, get to divide among themselves. The cost of washing all the shirts worn in the United State cannot be less than forty millions, annually!

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding months of delay requisite in transacting business through Eastern agencies.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

From the *Miner*, March 20th:

Imperial.—This tunnel was pushed ahead a distance of 16 feet last week.

The crushing and pulverizing machinery of the Monitor C. Mill are now ready to run, and further delay in starting the works is now only caused by the state of the roads, which prevents the delivery of flume lumber.

The proprietors of the Alpine tunnel, after several tests by assay, are now saving the rock as it comes out, believing that it will pay to work in mill.

Morning Star.—We hear a pleasant rumor on the streets that Mr. Kustel himself, who has just returned from Idaho, will soon come up and introduce his leaching process on Morning Star ores. The ores of the Rising Star mine, in Idaho, are very similar to those of our Morning Star.

In the Globe tunnel, this week, over a foot a shift has been made. This is more than double the rate of running heretofore made.

Chronicle, March 20th:

Pennsylvania Ledge Struck.—We congratulate all interested in Alpine county upon the striking of this mammoth ledge. The company, on the 6th instant, after nearly four years of hard work, struck their ledge, which is 8½ feet wide, of which four feet is solid quartz and the balance quartz boulders and decomposed quartz. The ore resembles that of the I X L, but the precions metals seem to be more evenly distributed. The ledge was struck at a distance of 918 feet from the mouth of the tunnel, and 500 feet from the surface. With the exception of the first 200 feet, the tunnel has been cut through hard granite the entire distance, to within 12 feet of the ledge, when they struck soft rock. After passing through the ledge, the tunnel cut through a seam of blueish clay 6 inches wide to the foot wall. From appearances, this mine promises to be one of the best.

Pittsburg.—The tunnel is being pushed ahead as rapidly as possible. It is now in about 720 feet, and it is thought that 80 feet further in it will strike the Dunkirk ledge, which is supposed to be an extension of the I X L.

From the experimental workings of the Morning Star ore, at the Markleeville mill, a ton of copper has been obtained.

AMADOR COUNTY.

Ledger, March 27th:

Alturas.—Forty-five tons of rock from this mine was crushed last week, and yielded over $40 to the ton. The shaft is now sunk to the depth of 60 feet, and the owners are erecting hoisting works.

Summit.—Work on this mine is being pushed night and day. The shaft is now over 200 feet deep, and the rock is of first class, yielding from $15 to $20 per ton. The machinery is perfect and kept in good order.

Casco.—The owners of thie mine are pushing the work on their shaft as fast as possihle, and are putting up a new engine of greater capacity.

CALAVERAS COUNTY.

Chronicle, March 27th:

We are informed that in Brackett & Co's claim, located in Tunnel Ridge, two pounds of gold were extracted last week.

Colby & Co., whose claim is located on the Old Woman's Gulch side of Tunnel Ridge, have their claim opened in good shape and are ready to commence active operations.

Shaw is still energetically striving to wash a hole through Stockton Ridge.

The Golden Gate Co. and Paul & Co. are also pushing operations with favorable results. Our mining interests are assuming a very promising aspect.

Work has been commenced on the old Union shaft in good earnest. A whim is being erected for the purpose of clearing the mine of water and hoisting the dirt. The proprietors, Messrs. Peters, Champion & Ahrnot, are all practical miners.

Lower Rich Gulch correspondence of same: The mining interest of Rich Gulch at the present time is rather dull. Alexander, Henry & Go. keep up the pounding in their batteries day and night, smashing up the rock and smashing out the gold, with a lead of ore nine feet in width, and managed in such a way that it is easily mined. The Palomo Co. is now erecting steam hoisting works.

EL DORADO COUNTY.

Placerville *Democrat*, March 27th:

New Ditch.—Mr. B. T. Hunt is having a survey made for a new ditch of large capacity to bring water st an altitude of 200 feet above the present Scuth Fork canal, to strike the South Fork of the American river in the vicinity of Brockliss' bridge. The altitude of the proposed ditch, we are told, will command a very large extent of good and permanent mining ground, which is now worthless for want of water. With this ditch completed the prospects of this city would be as hright as any place on the coast.

KERN COUNTY.

Havilah *Courier*, March 23d:

The McKeaduey mill is clattering away on rock from the Delphi miue. We are assured by Mr. Dalton, the present proprietor of the miue and mill, that within thirty days he will have taken out rock enough to keep the mill running night and day.

MARIPOSA COUNTY.

Gazette, March 26th:

The owners of the Washington mill, near Hornitos, cleaned up on the 14th instant, after two week's run, the sum of $2,775.

NEVADA COUNTY.

Transcript, March 24th: Mining operations have commenced in earnest. Since the late storm, Blue Tent, the latest locality to obtsin water, has ahnndance, and the miners are at work. At the Cascades one company is running 600 inches. From every quarter of the county we have good reports, and miners have great expectations for the season.

Rough and Ready.—The mining prospects in the vicinity of Rough and Ready are more encouraging than they have been for several years. We yesterday briefly alluded to the discovery of a nugget in the Racine claims owned by Miller & Co., on Squirrel Creek, weighing 16 ounces, and worth $300. In addition to this they took ont seven ounces of fine gold in three days. These claims were located ahout two months ago, and ever since they commenced working they have been taking out good wages. The hydraulic claims of Glidden & Co., and those of Rex & Barker are looking well. Dahle & Co's quartz mill has commenced running.

The Red Diamond at the Cascades, on Deer Creek, is turning out first-rate. The channel was reached on last Friday, and the first car load taken out yielded $20 in gold.

Same of 25th: Leavitt & Co. yesterday commenced washing in the Birchfield claims. They have just completed a fine flnme from Deer Creek, up Kelsey's Ravine, a half a mile in length.

Same of 28th:

The Red Jacket.—The Red Jacket Gravel Miniug Co. are about commencing work ou their claims. The channel is supposed to be a continuatiou of the channel which runs throngh Sucker Flat.

The Scandinavian Co. have commenced operations on their ledge, and are taking out fine looking rock, from a lode a foot and a half in thickuess. They have three arastras in operation.

At Mooney Flat the mining prospects are excellent. The miners have recently held a meeting for the purpose of making arrangements to open their claims, and it is thought they will commence a tunnel in the hill on the Deer Creek side.

Gazette, March 23d:

North Bloomfield Ditch.—On Tuesday the first installment of water from Little Cañon and North Poorman's creek arrived at the works of the North Bloomfield Gravel Mining Co. through their new ditch.

Grass Valley *Union*, March 26th:

Splendid Rock.—Yesterday, Capt. Lee brought in from the Empire mine, to Delano's banking house, a piece of quartz weighing about 80 pounds, that for richness in gold could hardly he excelled. Fine gold was distributed entirely through the rock, besides a good showing of sulphurets and galena. The lowest valuation of gold in the rock was placed at $800, and some estimated it as high as $1,200. The piece came from the 800-foot or present lowest working level of the Empire mine. From where this specimen came other rich quartz was blasted out yesterday morning, the estimated value of all being $2,000.

Garden City Claim.—The owners of this claim propose to give it a thorough prospectiug during the summer. We were shown several pieces of rock from it yesterday that looked well.

Same of 27th:

Rich Rock at the Empire.—Besides the rich rock taken from the Empire mine, on Thursday, of which we spoke in yesterday's issue, there was taken out during the day four car loads in all, from the same part of the ledge on the 800-foot level, worth $5,000.

The Rivot Process.—The company at Canada Hill have got the mammoth roaster in position, and set their machinery in motion. Every part works well.

Grass Valley *National*, March 24th:

The William Penn Mine, helow Hill's Ranch, is being energetically worked. Jas. Edwards & Co. have taken a contract to sink 100 feet, and are already down 38 ft., the shaft being 9x5½ feet in size. The ledge is from 18 inches to two feet thick, and is getting more solid.

PLUMAS COUNTY.

Quiucy *National*, March 20th:

Cherokee Items.—Bidwell & Co. are pushing ahead the work in their mine vigorously. They are running a branch tunnel from the lower or 150 foot level in the Caledonia, to the Dunlap lode, where they expect to find some rich rock. They were very near the ledge at last accounts. From their 100-ft. level the company are running a cross cut to what is known as the Big White lode. The rock prospects well, and some of it will be crushed in a short time. The Caledonia mill is running steadily, and doing well.

Jndkins & Kellogg's mill pounds along regnlarly, as usual, getting good pay. The rock in the lower level of their mine (recently opened), turns out to he good, and as they raise their shaft from the lower to the upper level, they find some extremely good paying quartz.

It is rnmored that the Bull Frog mill, near Rush Creek, will be started in a short time.

Cahalan's ledge proves to be a large one, his tunnel being over six ft. in quartz, and not throngh it yet. The rock prospects well.

SIERRA COUNTY.

Downieville *Messenger*, March 27th:

Gibsonville.—A friend informs us that water has begnn to start, and that in a short time the now well filled dump sheds will be empty, and a goodly quantity of precious metal in the pockets of the miners.

Port Wine.—Considerable excitement existed at Port Wine, owing to the striking of good pay in the Union mine. The owners were highly elated, and well they might he, some of their dirt paying ahout $5 to the car load.

Eureka and Morristown.—Water was just beginning to start, hut uot much work had been doue.

Howland Flat.—We recently visited the Union gravel mine. Plunging down the iucline in a car, we found a splendid tunnel called Broadway, dry with a douhle track, and with numerous evidences along the sides, that side tuunels had been run and the pay gravel taken ont. At the end we found workmen runuing the tunnel ahead and to the left to open a large quantity of new ground which is expected to pay well. The end of the tunnel is already supposed to be under pay, but will have to be carried some distance further to make a grade.

We learned that the Monumental claim was more than paying expenses. The Pittsburg is said to he paying moderately well.

SISKIYOU COUNTY.

Yreka *Union*, March 20th:

The United Quartz Co. had 35 tons of rock crushed this week at Dash & Co's mill. The yield was over $25 to the ton. Their claim on the Middle Fork of Humbug, is the same that was opened hy Isaac Ranck in 1852. They have sunk on the ledge to the depth of 90 ft. and have run two tunnels striking it at different levels. The ledge is over a foot in thickness and well defined.

Quartz on French Creek.—Ab. Spidell and Geo. Sanders have struck a quartz ledge on French Creek which promises well. It is ahont 12 inches in thickness and ahounds in gold visihle to the naked eye.

Etna Mining Claim.—They have struck the hedrock in this claim and expect soon to commence taking out money.

Oro Fino.—In this camp the miners have now an abnndance of water and all are busy at work. The ditches are full, caused by the melting of the snow hy the warm weather of the last two weeks. It is expected the mining season will he short there this year, but quite lively while it lasts.

TRINITY COUNTY.

Weaverville *Journal*, March 27th:

Northfork.—Accounts represent that some Frenchmen have found good mines on Yellow Jacket. The claims of J. Frutige and Henry Faubel are paying largely, and R. J. Holmes is drifting with first-rate success. Engle & Miller are at work in the quartz ledge on Rich Gulch, and have already taken out considerable rock for crushing. Some of the quartz which was taken to town and prospected in a mortar, yielded one dollar to the pound.

Rush Creek.—V. Chamberlin's claim is paying well, and there are three companies of Chiuese at work just below the mouth of the creek, who are helieved to be making money.

George W. Wood has extended his ditch some distance down the river, and will furnish water free of charge to all persons desirous of prospecting below it, until good pay is found.

TUOLUMNE COUNTY.

Sonora *Democrat*, March 27th:

The Eagle Mine.—For the past two months a full force of miners have heen employed on this mine getting out rock, and the mill was started a few days ago. We are informed that the rock on hand is very rich and that no donbt is entertained of the mine paying well. The Eagle is situated on Blue Gulch above Jacksonville.

French Bar.—A communication from this place, known also as Lagrange, says there is in that region a large extent of country known to be rich, which has never heen worked except hy rockers and rain water. A few are doing well. Kelly & Co. are taking out 160 ounces per week; Thursby & Co. are doing as well, while the claims of Messrs. Keogh, Rudolph and Thomas are patiently awaiting water.

On the East side of the river, the gravel hills do not seem to have been so well prospected; it is known, however, that they contain gold from the surface to the bedrock, and with snfficient fall. Between La Grange and the Crimea House, ahont fourteen miles, is a wild, broken country, whose gulches would furnish employment for hundreds of miners, if they had steady water. To the eastward, toward Don Pedros Bar, there is also a large extent of miuing ground yet unworked. One company there, Messrs. French and Brown, having had the forethought to build reservoirs, are now making from $10 to $15 per day to the hand, in '49 Gulch.

The attention of the Tuolumne County Water Co. has heen turned to the section described, and they are ahout instituting a survey to estimate the expenses of a ditch.

YUBA COUNTY.

Marysville *Appeal*, March 23d.

Brown's Valley.—It was reported in town yesterday that a rich ledge had boen etruck in the south drift of the Jefferson mine.

Same of 28th: We are informed hy a reliable person that very rich rock has been struck in the great ledge on which the Pennsylvania mill has been running for the last mouth—richer rock than ever beforo taken out of a mine in Brown's Valley.

ARIZONA.

From the Prescott *Miner*, March 6th:

Black Canon Diggings.—News from these diggings on Tuesday last, is quite favorable. We learned that the miners were making from $4 to $10 per day. Poland, Marsh & Co. had their ditch almost completed, and were confident that as soon as they commence washing they will make $20 a day to the hand. The proceeds of five pans of gravel from their claim weighed $1.70. It is certain that when properly worked, almost every bar on the creek will pay fair wages, and it is our opinion that rich creek claims will be struck whenever the creek hed can be prospected. If the hills on the west side of the creek are as rich as they are said to be, we have the best of reasons for believing that those ou the east side are still richer.

Lower Lynx Creek.—Late news from Jackson, Lovejoy & Co's hydraulic diggings on Lower Lynx Creek, eight miles east from Prescott, is quite cheering. Mr. Shoupe informs us that last week, after a run of 60 days,—three men working,—the sum of $360 was realized, which gives to each hand engaged $20 a day. On this same Lynx Creek there are miles of gravel hanks that will pay fully as well. Mr. Shonpe informs us that in an old channel in his claim, ahove Jackson & Co's, he has struck very rich dirt. His reservoir is nearly completed, and next week he expects to take out gold.

Same of 13th: Work is progressing at the Sterling. The Chase mine, in the tunnel, is looking well. Ore taken from it to San Francisco, by Mr. Noyes, yielded, hy working test, over $500 to the ton....On Saturday last, a letter from Theodore W. Boggs, who is opening the Independence mine, in Bug Bug district, stated that the lode opened fiuely, and was fully eleven ft. thick, with a rich pay streak, half the width of the ledge....C. C. Bean, of this place, has purchased the interest of A. Freuch, in several lodes in Walker's and Hassayampa district, for the sum of $4,000, and has sent a gang of men to Walker's to work the Tie-Tie, which is said to ho a very rich gold lode ...We have no placer miniug news this week, the miners being too busy at work to come to town....A letter of recent date from San Francisco, states that the Sterling Co. had secured the services of a No. 1 mining superintendent, and that he would leave in a few days for this

country....The news from Wickenburg, where the ore from the great Vulture mine is worked, is as of yore—both mills running night and day and paying well....At Gila City, Eureka, and other places in Yuma County, parties are working quartz, with what result we do not know.

BRITISH COLUMBIA.

Portland *Oregonian*, March 20th:

From the Kootenai Mines.—News has been received in this city, by letter, to the effect that a great many of the people in the neighborhood of Fort Colville have gone to the Kootenai mines during the winter and many more are going this spring. There is talk of opening a new trail to these mines as soon as the snows on the mountains shall be sufficiently melted to allow of work.

IDAHO.

Owyhee *Avalanche*, March 20th:

Ida Elmore.—The teams have been engaged hauling quartz for several days. A large quantity is now piled at the mill. The mine is now producing more ore than ever, of a very rich quality. The mill will be started up on Monday.

Mining Difficulty.—The rich placers of Calaveras Flat appear at present to be a huge bone of contention. Work is suspended and the vicinity is in a state of siege. The Henry Brothers, who have worked the claims for two or three seasons, are in possession. Messrs. Curlew, Brown, Woodward and others contend that the Henrys have not complied with the mining laws, and have, therefore, forfeited their tenure. We know nothing of the merits of the matter.

Crane & Driggs.—An assessment of $12 per share was levied upon the capital stock of the above company, payable on the 10th inst., at Portland. This mine is near the Golden Chariot. It was formerly worked by the Oregon Steam Navigation Co. There is a shaft 200 ft. deep, said to have produced some very rich ore. The prospects are that work will be resumed this spring.

Flint Items.—The Rising Star mill started on Thursday. The prospects are good....Black's mill will start up in a few days, on Astor rock.

Silver Cord.—We are informed by Mr. Jones, Superintendent, that the work on the mine is progressing finely. Hoisting works are to be erected early in the spring.

Idaho City *World*, March 11th:

Elk Horn.—From Mr. Mesick, we learn that the company have already about 400 tons of good ore for crushing, which was taken out of the ledge this winter. The quantity of snow on the mountain about the mill is not so large as was promised from weather indications a month ago, but yet good heads of water will be supplied to the ditches over on that side of the Basin for a fair season of mining.

Silver City *Tidal Wave*, March 19th: The Golden Chariot keeps up its lick in the yield of bullion, and is now in excellent shape for a good summer's work.

The road to the mines is becoming bare in many places, making the operation of quartz hauling rather difficult.

Same of 23d:

Rising Star.—Ten large bars, weighing nearly 500 lbs., and valued at $7,125 coin, or between $9,000 and $10,000 currency, were shipped by the Rising Star Company through Wells, Fargo & Co. to San Francisco yesterday morning.

NEVADA.

HUMBOLDT.

Register, March 20th:

Star District.—Joseph Organ has leased the Sheba mine, and is preparing for active operations. The Sheba ore is rich, some of it assaying as high as $8,000 per ton, but very refractory. It is the intention to ship the ore to San Francisco or to Swansea, for reduction.

On the National work has again commenced. A few years ago a large quantity of quartz from this mine was reduced, which paid from $30 to $250 per ton in gold. The ledge is large and well defined.

Humboldt can boast of as rich ore as can be found in the State of Nevada, or elsewhere. We will wager a hat that we can produce a specimen from the Grant mine, in Indian district, as rich in silver as any piece of its size in the State. Test to be made and bet to be decided by an assayer in Virginia City or Gold Hill. Who wants it?

The shaft on the Sixty-nine ledge is now 60 feet deep, and the vein is well defined and three feet wide. The average yield of eight different assays of the ore was $150 per ton.

T. G. Negus shipped this week, by the Pacific Union Express, from his mine at Golconda, 1,116 ounces of bullion, valued at $1,500.

The Little Giant Co., at Battle Mountain, shipped two bars, valued at $1,800.

The Silver Mining Co. shipped this week 4,103 ounces of bullion.

REESE RIVER.

Austin *Reveille*, March 25th:

Belmont.—Three bars of bullion from Col. Buel's mill, at Belmont, were brought into this city by the stage which arrived last night.

Mountain Champion, March 20th:

Belmont—We are informed that the Company's mill will remain closed until the White Pine excitement subsides a little, when it is presumed that it will be possible to obtain miners who will work steadily at fair wages. Considering the fact that this last run on Transylvania ore has yielded $257 per ton, it is to be regretted that men have become so wild with the White Pine fever as to compel the company to suspend operations for the want of laborers.

Stone Cabin Range.—Late last evening Mr. Reed arrived in town with two and a half tons of beautiful ore from the Seneca mine, in the Stone Cabin Range, 15 miles to the south of this place, which experts say will work from $300 to $400 per ton.

El Dorado South.—Notwithstanding the scarcity of laborers work progresses, and the ore being raised is as rich as heretofore.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Territorial Enterprise, March 23d:

The Justice and Independent are finding excellent ore. An assay of rock from the west vein at the 160-foot level, yielded at the rate of $600 per ton, and the average appears to have improved.

On the Belcher work is being vigorously prosecuted. No strike has been made, though small veins and stringers of good ore have been found.

On the Sacramento we understand that work will be resumed shortly. The ore will be crushed in the Summit mill.

Same of 24th:

The Yellow Jacket mine is looking exceedingly well.

Same of 25th:

The Ophir drift west from 700-foot level of the new shaft is in over 100 feet. The rock encountered is very hard, but about two or three feet a day are made.

The Savage mine is yielding at the rate of over 1,000 tons a week of ore averaging nearly $40 per ton.

Hale & Norcross.—The shaft of the upper works is being retimbered between the 175 and 300-foot levels. At the new shaft the lower level is yielding large quantities of excellent milling ore.

Same of 26th:

The Sierra Nevada Co. have struck in their car tunnel the same deposit of rich rock and dirt that they have above. The rock which is being extracted is exceedingly rich.

Same of 28th:

The Gould & Curry repairs being completed, resumed work night before last. When the pump started the accumulated water in the shaft measured 320 feet in depth; yet the company expect to be able to clear it within three days. The pump works splendidly.

The Occidental Co. yesterday sent to Gold Hill for melting and assay 400 pounds of crude bullion, the result of their last week's run. This lot of bullion will yield, it is thought, nearly $12,000.

Crown Point.—It will take several days yet to make the necessary repairs to the main shaft, when the drift east at the 1,100-foot level will be proceeded with again.

The Adriatic is again attracting attention. They now have out at their mine about 150 tons of good milling ore, with plenty more in sight and conveniently situated for extraction.

Imperial-Empire.—The new cable for the shaft is now in use. It is of the best English steel and wider and better in every respect than the old one. During the delay occasioned by the breaking of the old cable the water accumulated in the shaft to the depth of 100 feet. It will probably be hailed out to-day.

Gold Hill *News*, March 24th:

Chollar-Potosi.—The rock in the drift east at the 1,240 foot level from the shaft grows harder as the drift advances. It is pretty good blasting ground, however, and satisfactory progress is made.

Jayhawk and Bilkemall.—The Mohawk and Montreal Consolidated Gold and Silver Mining Co. have postponed the time for declaring delinquent their last assessment of $3 per share until March 31. The reason probably is that the stockholders are beginning to lose faith in the management.

Carson *Appeal*, March 25th:

Some excitement occurred hereabout yesterday, occasioned by the reported discovery of rich gold and silver bearing quartz a few miles south of Empire City, and about eight miles from Carson in a southeastly direction. Extravagant reports were in circulation, to the effect that it was a new White Pine, and that 1,000 persons were on the ground seeking for good locations. A German who came direct from there to Carson, last evening exhibited to us a specimen of the outcropping of the rock, and asserted there were several hundred persons there who would camp upon the ground, and that the excitement among them was very great. We have no further particulars.

WHITE PINE.

[The latest items of news and information from this district will be found on another page.]

WYOMING.

Sweetwater *Mines*, March 10th: We have been informed that on the 4th inst. a very rich lodge was discovered in the California district, by Mr. Soles. No name has been given it yet, but prospecting and development is going ahead. Several ledges have been discovered close around this town during the present month, that promise to turn out something good.

Frank Zerrener, superintendent of the Young America mine, is increasing his force of men, and will probably in a month or two have some 60 or 70 hands employed.

A shaft is down on the Golden Leaf ledge 35 feet, and very rich ore is being taken out of a crevice averaging about 24 inches in thickness. A specimen we saw was sticking full of free gold.

The Bed of Sweetwater River.—"N. L. T." writes that he prospected the banks of the stream a little last summer, and found everywhere from one to three cents to the pan; but that he was prevented from doing anything further by the Indian scare. He says: "I believe, and so do others, that good pay can be found on bed-rock, in Sweetwater, below the cañon, and probably very rich diggings. It will require persons with some capital to test it, as doubtless it is deep to bedrock. There is ample work on this stream for 100,000 persons, provided it should pay. Gold can be found in the bars and along the edges of the water all the way to the mouth."

Baron Von Reichenbach, Again.—A physician writes to the Dublin *Journal of Medicine* in support of the notion that people sleep much better with their heads to the north. He has tried the experiment in case of sick persons with marked effect, and insists that there are known to exist great electrical currents, always crossing in one direction around the earth, and that our nervous systems are in some mysterious way connected with this electrical agent. Baron Von Reichenbach's book on the "Odic Force," published some years ago, detailed a large number of cases which occurred in the practice of the author, where abnormally sensitive individuals were benefited, and in some cases cured, by acting upon this idea. The Baron urged that the bodies of the patients should coincide with the axis of the earth, in order that the current of terrestial electricity which is constantly passing round the earth at right angles to that axis, might have no disturbing effect upon the analogous current of animal electricity which is as constantly passing around the axis of the patient,—of which axis the head and feet are the poles.

The Railroad and the Indians.—The impression seems to prevail that the Indians will not make any serious attempts to interfere with the operation of the Overland Railroad. The Reno *Crescent* thinks the "Iron Horse" will do more to subdue the Indians in one season than all our forts and Indian armies could do in many years; and adds the following paragraph, which, although it contains a deal of fancy, no doubt conveys much of fact: "The savage can combat with his pale-faced brother man to man; he knows the pale face, like himself, is vulnerable and mortal; but in the iron steed there is a something incomprehensible. He hears the roar of the iron chariot wheels, the shriek of the whistle, the clang of the bell, and the hoarse respiration of this fiend. He sees it move forward and backward at will, with speed that puts to shame the swiftest rider of the plains, and his spirit is humbled and his courage cowed."

The Earth.—Although there are at least sixty-three chemical elements known to exist in the earth, yet one of these, oxygen, forms nearly or quite one-half of its entire bulk, so far as known to man; two other elements silicon and alumiaum form about a quarter—leaving but one-quarter more to be made up from all the remaining sixty original elements. The next, in order, most abundant elements are probably calcium, iron, carbon, hydrogen, nitrogen, etc. While the metallic elements are far the most numerous, the non-metallic are much the most abundant in quantity. The metallic elements are characterized for sameness, the non-metallic for variety in qualities. The idea that the earth was once in a gaseous condition is greatly confirmed by the fact that about half the known substance of the globe, by weight, may be rendered gaseous at ordinary temperatures. The difference in density between the heaviest known elements is as 1 to 257,000—platinum representing the former and hydrogen the latter. The sun is known to have an almost infinite number of elements—the spectroscope develops at least 1,000.

Gold Excitement in Scotland.—A gold placer has recently been discovered along the banks and bed of a creek on a farm tenanted by a Mr. Rutherford, on lands belonging to the Duke of Sutherland, in Scotland. About 150 miners were, at last accounts, at work there, including several experienced returned Australians. Some $200 worth of gold had been purchased by a neighboring jeweler. Gold has been found there in very limited quantities ever since the days of James the First, and the Duke has still in his possession a ring made of gold found there some thirty years ago.

A Boston Notion—Monster Concert.—The Bostonians are making arrangements for a series of monster concerts, to take place on the 15th, 16th and 17th of June next, at which there will be one thousand instrumental performers, and a chorus of twenty thousand voices, mainly selected from the public schools. A temporary building is to be erected for the occasion, and the President and other dignitaries, as well as the Governors of the States, will be invited. The secret of the whole matter is the suppositious inference that the crowd of strangers which will visit the city on the occasion, will leave about $8,000,000 at the "hub."

Illustrated Trade Circulars are rapidly increasing among manufacturing establishments in the East, and will soon become popular on this coast. We have recently received a good sized catalogue, published some time since by W. T. Garratt, brass founder, on Fremont street, which contains illustrations of many articles in his line.

Water vs. Land Transportation.—It appears from a memorial recently addressed to the New Jersey Legislature, that more than half of all the goods transported between New York and Philadelphia, are carried by the circuitous sea route, in preference to the more direct land route; and this, notwithstanding there are two distinct lines of railway and an inland water route by way of the Delaware river and Raritan Canal.

Large Map of Mexico.—Colton, of New York, has just issued a large wall map of Mexico, including all the country round the Gulf, about 4x4 feet in dimensions. On the margin are smaller maps of Spain and Cuba. It is a useful map, but contains nothing new or topographically than is given in Colton's complete atlas of some years ago.

San Jose is unquestionably the best governed city in California. It is not only free from debt, but has $50,000 invested in county bonds.

Notices to Correspondents.

"MAT OF THE MINT."—The wear of gold coin underwent an elaborate investigation from 1798 to 1801, the conductors being the celebrated chemists, Hatchett and Cavendish. The report occupies 150 pages of the "Philosophicel Transactions" for the year 1803. From the experiments made, the reporters declared that only two metals were adapted to alloy with gold, in order to increase the durability of the latter, viz., copper and silver. One of the experiments consisted of a given number of coins composed of various alloye, being placed in a square box. Into this were placed forty pieces of coin of equal size and weight, but varied alloy, all, however, being what is known as fine gold, or 22 carats fine—22 gold and 2 alloy. The box was made to rotate on its axie, so that the coins rubbed against each other. It was found on examining the contents of the box after having been rotated 71,720 times, that the alloy of silver and copper, euch as used formerly for coinage at the English mint, was more durable, or less diminished by abrasion, than the fine gold *alloyed by silver alone*, or that *alloyed* by copper alone; the loss in the first case being found only to amount to 1-230th part, and in the second, to about 1-29th part. Yet it is a fact that the English Government is in the constant practice of melting up its old sovereigns and guineas, composed of the first named, and more durable alloy, and replacing these old coins with gold alloyed with copper alone. We believe all European governments now follow the same practice, and the United States mint also. In the second column of page 195, of our last number, will be found a brief account of some recent experiments in the alloy of silver by the officers of the French mint, by which, for reasons there given, it is recommended that silver coin should be alloyed as follows: 835 parts silver, 93 copper, and 72 zinc. If all civilized nations would agree to employ the above proportione of alloys respectively, for silver and gold coins, great economy would result in their wastage.

VISALIA.—The carp, says Isaac Walton, "is the queen of the rivers." Had be said ponds, the old angler would have been nearer the mark. There can be no doubt but that both carp and tench, if introduced, would flourish well in the upper parts of the San Joaquin, and add much to the luxuries of the neighboring districts.

S. C. W., Timbuctoo.—The article inquired about, relative to the "uniting of zinc with quicksilver for the purpose of increasing the affinity for gold," was perhaps d'Henreuse's zinc process; or an item of ours describing several simple methods of getting zinc out of quicksilver. Find out the date, or page.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

Separation of Bullion in Bars without Granulation.

A patent for this mode of separatiog gold from silver was applied for in 1865, by John Reynolds, a boiler in Kellogg, Heuston & Co's refinery in this city. It was a return to first principles, known and practiced in the separation of metals for a hundred years; but not being the general practice at the time, or since granulation had got into practice as an approved preliminary operation, (in order, theoreticelly, to present so much larger a surface for the acid to work upon,) this patent was allowed, somewhat to the surprise of other experts in the business, who had not thought of such a thing as a patent in so simple a matter. It is in the mein, merely for putting the bullion bar at once into sulphuric acid, instead of pouring it first into water to granulate, and then putting it in. Separation of gold and silver, or "refining," is done at the Mint with nitric acid in porcelain vessels set to boiling by steam, as iron pots would be destroyed by the nitric acid; and a common fire cannot be used for heating because it would crack the porcelain vessels. The reason why nitric acid is in use, —so much more expensive and even less efficient than sulphuric acid—is because the mints are usually in town, and the fumes of the latter acid cannot be tolerated there. Sulphuric acid admits of the use of iron vessels, and of the most violent boiling, by a direct coal fire. Hence sulphuric acid is used wherever the circumstances admit.

A ber of silver bullion cast into boiling sulphuric acid of the proper density, dissolves "like butter," figuratively speaking, leaving the gold in a brown sediment at the bottom. Reynolds noted this fact—and that it was not at all necessary to granulate in the process with sulphuric acid, but that, on the contrary, the separation would be more rapid and thorough without it, rendering the intermediate melting likewise unnecessary.

The cause of this difference in favor of bars was for some time a puzzle; but there are two good reasons assigned for it. One is that, in treating granulated bullion, as the silver rises into solution and the gold thickens at the bottom, the latter partially covers up some silver-holding grains, and prevents the acid from operating upon them. This can be prevented by stirring. The other reason is a theoretical one, which, however, is believed by the Philadelphia mint refiners to be founded in fact, viz: that in pouring melted bullion into cold water, the sudden chilling is attended by a tendency on the part of some of the golden particles in the alloy, to come to the surface of the granule. Thus the latter gets coated to a degree, (scarcely or not at all perceptible, it is true), by the richer metal, which is impervious to acid, hindering the process of separation.

Assayers and refiners feign that they would pay little or no attention to Reynold's patent if they had any occasion to separate buttons or bars by the use of sulphuric acid. Whether at law the Patent Office would be sustained in the matter, is a question that need not be entered into in this connection. To furnish an idea of the exact neture of Reynold's patent, we quote from the document itself. The inventor says:

"I take a charge of crude bullion of any convenient weight (a pot which in working by the old process would work a charge of from 130 to 140 pounds, will in working by my improved process work from 300 to 400 pounds) and place it on the bottom of an iron pot, adding a sufficient amount of sulphuric acid to cover the said charge of bullion, and boil the whole mass together for about one hour, after which I add more sulphuric acid, from time to time, as may be necessary, until the silver and baser metals are all dissolved and held in solution in the acid, the whole amount of acid required being generally about equal in weight to the charge of crude bullion in the pot.

The time necessary for boiling will very according to the heat applied; the usual time being from four to five hours.

The acid holding in solution the silver and baser metals is then drawn off or bailed into a tank lined with lead, leaving the gold settled in the bottom of the pot, where it is washed with hot sulphuric acid, in order to remove as much of the sulphate of silver remaining as possible.

I then place the gold in a filter corresponding in size to the amount of gold to be treated, where hot water is poured over it until it is perfectly sweetened, that is, until no trace of sulphate of silver or acid can be found in the water as it runs away from the gold. It is then pressed and dried, after which it is melted and molded into ingots or bars, whose fineness will be found to be from .992 to .994½.

The tank into which the solution of silver and baser metals is drawn off is supplied with a perforated lead pipe, through which steam is introduced for heating purposes, as in the method now in common use. It is then drawn off into a precipitator in which heat is kept up by means of steam passing through a closed lead pipe passing through the said precipitator. Copper is now introduced, as in the old process, which precipitates the silver in metallic state of fineness varying from .995 to .998.

The copper remaining in solution is then drawn off into the copper house, where it is converted into crystals by the methods now well known and in common use in refineries.

Some of the advantages to be derived from my improved process of "refining gold and silver bullion," may be enumerated as follows:

First—The melting and alloying with copper and granulating before treating with sulphuric acid, are rendered entirely unnecessary.

Second—By my process, gold from .992 to .994½ fine is produced by the first treatment, whereas by the old process with one treatment, gold of the fineness of only .950 to .970 is produced, rendering it necessary oftentimes to go through the process two and even three times before the gold can be brought up to a fineness of .992 or .994; thus increasing more than double the expense required by my improved process of refining.

Third—Close returns can be made by my process every day, whereas two or three days or more are required in order to make close returns by the old process.

The claim is for "the improved method of refining gold and silver bullion in bars or bricks, or any other shape, whereby the necessity of melting and alloying with copper and granulating before refining is obviated, substantially as described."

MRS. HALL'S SMELTING FURNACE.—The *Alta* inquires what has become of the Volcano Smelting Furnace invented some years ago by Mrs. E. J. Hall, and highly spoken of at the time of its trial in this city, in 1864. The inventor is in this city, and anxious to furnish those interested in smelting with data to judge of the value of her invention. In principle Mrs. Hall's furnace is an attempt to solve an interesting and important problem to the metallurgist—to smelt reductively in such a manner as to prevent sulphides from forming a matte product (or sulphur-metal), by desulphurizing and reducing the matte as fast as formed. In ordinary smelting there are two ways of desulphurizing matte; the simplest, and the kind practiced in assaying, is to throw in iron, which has a greater affinity for sulphur, and therefore takes it to itself; but the cheaper and more generally practiced is a separate treatment of the matte, in which grinding and roasting are finally resorted to as the only thorough means of accomplishing the desired result —the oxygen of the air in that case carrying it off. Mrs. Hall endeavors, by confining the whole in an egg-shaped furnace supplied with powerful blasts and having a comparatively small flue, to burn out the sulphur with charcoal, in the form of gaseous sulphides of carbon, and SO^2 as fast as it combines with liquid products at the bottom. Having seen only a drawing, we are not able to furnish further details at present.

MORE FOSSIL DWARFS.—Mr. Busk has discovered in Malta, a species of dwarf fossil elephant only 2½ to 3 feet high. Dr. Falconer has found another about 4¼ feet in hight.

"Mad Stones"—What are They?

The public is frequently treated to newspaper paragraphs, alluding to remarkable cures of the bites of mad animals, and poisonous reptiles and insects, by what are termed "mad stones." The subject has been revived in this city, the past week, by correspondence in two of our dailies, from one of which we learn that we have one of these wonderful "Stones" in San Francisco. During our newspaper reading, for the past ten years, we have been curious to collect, among other matters, such accounts of these "mad stones" as have come under our observation. The reports all agree as to their wonderful effects; but differ very widely in the description of the so-called "stones." Thinking it may interest some of our readers, we have collated the following items from our clippings, from which it will appear that any person may become possessed of a "mad stone," equal to the best, at a trifling cost or trouble:

Carlos Johnson, of Warwick county, Indiana, is in possession of one of these remarkable stones, which was originally brought from England; this specimen is a specics of pumice stone, very porous and of greenish color.

Mrs. Baugh, Valparaiso, Ind., has one which was recently shown to Professor Wyhe, of the State University, of Bloomington, Ind., who immediately produced a counterpart of the same from the University collection of minerals, and which was there classified as a corel of the genus *astrea*. This stone was a portion of one originally brought from England by the mother of Mrs. B's husband, who, at his death, divided it into three pieces, and gave one each to his three children.

Mrs. W. Bundy, of Martinsville, Ind., has one which has also been pronounced by Professor Wyhe to be an astrea corel.

The late John King, of Richmond, Va., had one in his possession about twenty years, from the application of which wonderful cures are claimed, but the stone is not described.

Dr. R. H. Ayres, Jackson, Tenn., has one of a cubical shape, containing about seven cubic inches of matter, and which, from the description, we presume must be an astrea coral.

Mrs. Taylor, Terre Haute, Ind., has one which has been in her family eighty years, and which is described as being "white, smooth, hard, with star-shaped pores, two inches in length by three-quarters thick," most probably another astrea coral, with one of its surfaces ground smooth.

Col. B. Lee Milam, Waterford, Marshall County, Miss., has one (the same as described in the *Herald* of Monday last) about the size of a hen's egg, one end of which is flat, as if sawed off across the grain, having very much the appearance of wood or bone, said to have been brought from China, by Dr. Barker, in 1810. Has been offered $5,000 for it; will sell it for $10,000; and well he might, as he could probably produce a counterpart equally good for five dollars.

The publication of the description of the above, brought out Dr. Horst, of this city, who keeps an apothecary store corner of Eddy and Taylor streets, and who has one which closely answers the above description, which he obtained, as a great favor, from an Abysinian chief, during his travels in that country. We have carefully examined the same, which is undoubtedly a piece of petrified bone, cut across the grain.

There are said to be several so-called "stones" in Southern Virginia, which are of undoubted animal origin, pronounced by some to be portions of the rennet of some animal, whether dried or fossilized, we are not told.

We have descriptions of quite a number of others, in different parts of the country,

to the use of all of which are ascribed wonderful cures.

From the above it must be inferred that there is no uniformity in the material of which those "stones" are composed. The accounts given of the circumstances attending their assumed cures also lead us to infer that there generally has been no virus injected into the persons of those upon whom the cures are supposed to have been made, and that in most cases other remedies were also used, from which probably more benefit was derived than from the "mad stone." It is possible that the porous substances used may have some effect in extracting the virus, when applied instantly; but any one substance of equal porosity with another would, no doubt, be equally as efficacious. There is also a possibility that when the stones are composed of coral the carbonate of lime may have a chemical effect in neutralizing the virus, which is generally of an acid nature; but such an effect could not result from the use of pumice stone, or of fossil organic substances, where the original material has been replaced with silica. The adhesive character of lymphatic discharges from a slight wound will generally cause any porous substance to adhere, if promptly applied.

In view of the above, we believe that any person who thinks he may have been bitten by a mad animal or venomous reptile, would be much more likely to obtain relief from the application of ammonia, a poultice of tobacco and soap, or an application of bromide of potassium, with a free use of strong alcoholic stimulants, than to rely upon the supposed virtues of a "mad stone." A piece of light dry bread would be more efficacious than a "mad stone," made from a petrified bone.

Industrial Enterprises.

A RUBBER FACTORY, says the *Herald* of the 31st, is about to be established in this city; an agent or superintendent and raw material being now on the way from the East. Not only the caoutchouc tree, but the gum of the asclepias, euphorbia, poppy, lettuce, and chicory plants, will furnish elastic material suitable for manufacturing purposes; and the company proposes to introduce the cultivation of one of these. California uses large quantities of rubber goods. The consumption in the United States amounts to about $8,000,000, the capital invested in the manufacture being about $5,000,000.

CALIFORNIA ALE AND PORTER.—Mr. Samuel Marks has established a brewery at the corner of Folsom and Fourteenth streets, which produces an article pronounced by the *Alta* reporter to be superior to, while it is cheaper than "Barclay & Perkins." The chief point of difference between the manufacture of ale and lagor is, that the beer is generally ready for use in two or three days, while ale requires two weeks.

COÖPERATIVE WINE MAKING.—The Wine Makers' Association of Los Angeles presents a successful example of the coöperative principle applied to wine making, and to the relief of vintners from exclusion by isolation. The company has two storehouses of stone and brick. One is above ground, 42x270 feet, and the other is a half basement, 40x90 feet. It has on hand 150,000 gallons of wine and 60,000 gallons of brandy. Its superintendent, M. Emile Vaché, is a Frenchman, and he makes Sherry, Madeira, Port and brandy. Grapes are bought at 75 cents to $1, those of shareholders having preference. Every workman employed is a stockholder. It has a house in San Francisco, and divides 25 per cent. per annum on its capital of $50,000, with assurance of improvement.

CANVASSING FOR THE OROVILLE WOOLEN MILL.—The Oroville *Record* of March 27th says of this mill enterprise: Berry, of San Francisco, visited Oroville on Thursday, and canvassed the subject of a woolen mill for Oroville, with many of our citizens. The prospect is fair for the erection of a woolen mill here, most of our citizens viewing it favorably.

THE OAKLAND COTTON FACTORY has changed hands, and been converted into a bag factory. The demand for grain bags, etc., this season, will not fall much short of twelve million in number. From 700 to 800 pounds of manila jute have been ordered shipped, at an outlay of $75,000.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & CO., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING FEBRUARY 16th.

86,898.—IMPROVED WASHING FLUID.—Jas. Bell, Sonora Cal.:

I claim the above described composition for washing fluid made of the ingredients enumerated mixed or compounded in about the proportions specified.

This compound is intended for general use in washing, and is claimed to be superior for softening hard water and rendering the water suitable for cleansing purposes.

86,931.—IMPROVEMENT IN WINDING RATCHET TIME PIECES.—Wm. H. Lamb, San Francisco, Cal.:

1. I claim the disk D, operating in the indentions of the ratchet wheel B, and impinging against the plate or equivalent device for preventing the wheel from turning backward, substantially as described.

2. Forming the wheel B, with indentions C, C, C, to fit the circular shape of the disk, and holding the said disk between the incline F, and the wheel by means of the spring E, substantially as described for the purpose set forth.

The nature of this invention is to provide a ratchet for time piece, so constructed that it cannot be wound the wrong way up, winding the pieces, and thereby breaking the teeth of the ratchet wheel in the ordinary construction of time pieces. The inventor is a practical watchmaker, of long residence in this city.

86,932.—IMPROVEMENT IN BRICK ELEVATOR. Thos. Mann, San Francisco, Cal. (Antedated Feb. 1st, 1869.)

1. I claim the gates C, C, sliding on the ways B, B, B, B, operated by the ropes or cords G, K, K′, and pulleys and blocks H, J, J′, L, substantially as and for the purpose set forth.

2. The peculiar construction of the brake M, with the sweep O, operating in the slot P, so that the driver may hold the gates in position, while the horse is changing his direction of travel, substantially as described.

3. The books S, S, for attaching the hods to the gates, substantially as described.

This is an improved device for hoisting brick and mortar for building purposes, and is intended to be employed after the first or lower story has been constructed. It consists of a frame which is well braced, having vertical posts or ways on which gates slide up and down. The gates are constructed so as to admit the hauging upon them of mortar and brick hods. While one gate is ascending on one side with loaded hods, the opposite gate is descending with empty hods, by means of cords passing over a pulley at the top of the frame. The inventor is now a resident of Portland, Oregon.

87,020.—IMPROVED MOTIVE POWER FOR SEWING AND OTHER MACHINES.—Jacob Zuckermann, San Francisco, Cal.:

I claim the motive power consisting of the frame, the series of semi-elliptic springs D, connected at their ends by hinge joints, in combination with the spirally grooved fusee G, the fusee and the springs being connected by means of the chains, the gear wheels, shafts, belt and brake, the whole constructed and arranged substantially as and for the purpose set forth.

The object of this invention is to provide an improved motive power for light machines, and more particularly for sewing machines. The device is applicable to any of the machines for sewing, giving the requisite motion, by being occasionally wound up. It consists of a series of gear wheels operated by a series of semi-elliptic springs united at each end by hinged joints, and so arranged that the power exerted upon the machine will be uniform. The number of parts liable to get out of order are few, while the machine can be constructed very cheaply. A company of capitalists in New York have engaged to manufacture and introduce the machines into use.

87,077.—IMPROVEMENT IN ELEVATED RAILWAYS.—Wm. A. Sutton, New York, and Eugene Crowell, San Francisco, Cal.:

1. I claim the combination of the sprocket wheel C, and brake applied to hold the same with the endless rope B, having knots, collars, or protuberances b, on it essentially as herein set forth.

2. The rope-lifter constructed substantially as described, of a sheave c, carried by a lever I, which is pivoted to a rack J, operated by a pinion K, essentially as herein set forth.

3. The combination with a rope lifter constructed to operate substantially as described of the sprocket wheel C, arranged to have a sliding motion or lateral adjustment relative to the rope, essentially as specified.

4. The rope take-off or shifter e, L, in combination with the sprocket wheel C, arranged to have lateral adjustment relatively to the rope, substantially as described.

87,082.—IMPROVEMENT IN FOLDING CARD GLOBE.—Dennis Townsend, Fiddletown, Cal.:

1. I claim a flexible, expansible and compressible geographical or manographical globe; when made of a series of quadrantoo triangles, substantially as described.

2. Also a coating or covering for the superfices of a collapsible hemispbere, when figured and made of one piece in quadrantal triangles, joined at or near a common apex, substantially as and for the purpose described.

3, Also combining the two halves of the superfices of a globe on an equational line by means of a joint between each pair of quadrantal triangles, substantially as and for the purposes specified.

4. Also the combination of folding ligatures with the quadrantal triangle, substantially as and for the specified purpose.

5. Also in combination with the flexible globe, the bow spring for expanding it substantially as described.

6. Also the combiuation by attachment of a compressible globe with the eover of a book or with a base confined witbin such covers.

Issued February 9th:

86,840.—IMPROVEMENT IN DRIERS.—C. Kaibel, Sacramento, Cal.:

1. I claim the stationary caps C, C, and perforated hollow shaft E, in combination with the perforated drum B, and fan-blower G, substantially as and for the purpose described.

2. The arrangement and eombination of the furnace A, Blower G, caps C, C, C′, C, drums B, B′, perforated bollow-sbaft E, E′, trunk I, discharge-tube J, all substantially as and for the purpose set forth.

The inclined trough L, in the lower part of the furnace A, in eombination with the perforated drums B, B′, substantially as and for tbe purpose set forth.

Issued February 23d:

87,260.—TIRE-UPSETTER.—William M. Hughes, San Francisco, Cal.:

I claim the combination of the parts I, I, plate J, tbe clamp E, the wheel and eccentric F, the compound F, eccentric H, the handles A, A, lever G, and cams or eccentrics B, B, substantially as shown for the purposes specified.

Brief Hints to Inventors.

The assignee of every invention may have the patent issue to him directly, when he is the purchaser of the entire interest; or the patent may issue in the joint names of the inventor and assignee, the inventor himself being one of the assignees.

The application must be made by the actual inventor, if alive; but if the inventor be dead, it may be made by his executors.

A working model is always desirable to enable the office to determine its precise operation. The name of the inventor and also of the assignee, if assigned, must be fixed upon it in a permanent manner.

What is really embraced in the original invention, and so described or shown that it might have been embraced in the original patent, may be the subject of a reissue.

The mere fact of prior invention abroad will not prevent the granting of a patent, unless the invention had been described in some printed publication.

When the patent is applied for in the United States, after being obtained abroad, it will extend only fourteen years from the date of the foreign patent.

Patentees or assignees are required to affix the date of the patent on each article vended or offered for sale, under a penalty of not less than one hundred dollars.

Every assignment should be recorded in the Patent Office within three months from its date.

If old materials and old principles are used in a state of combination to produce a new result, the inventor may obtain a valid patent for such result.

When an application has been rejected, the inventor may manufacture his invention for two years, with the privilege of renewing his application within that time, if he so desires.

The inventor or inventors must sign the petition and claims, the latter to be attested by two witnesses, also take the required oath before some authorized person.

DEWEY & CO.,

American and Foreign Patent Agents, Mining and Scientific Press Office, No. 414 Clay street, San Francisco.

RETURNED.—Or J. H. Paine, Dentist, Wadsworth House No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

O. M. TAYLOR, who acted as agent a brief time for this paper in Washoe, is requested to call at or address this office without fail.

PHOTOGRAPHY.—For CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.
10v18-6m B. F. HOWLAND.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block San Francisco. 6v18-3m

[From the new "Dominion."]

At this season, when coughs and colds are so prevalent, an effectual remedy, and one easily obtained, is Perry Davis' Vegetable Pain Killer. It is no new nostrum, vended by unknown agents, but has stood the test of over twenty years, and those who use the article, internally or externally, will connect with it grateful recollections of its worthy inventor.—*Hastings' Chronicle, C. W.*

PAIN KILLER.—The testimonials borne to the efficacy of this valuable medicine are sufficient to warrant its introduction in every house. Our own opinion is that no family should be without a bottle of it for a single hour. In flesh wounds, aches, pains, sores, etc., it is the most effectual remedy we know of. A bottle will last for a very long time, and its low price places it within the reach of all.—*St John News.*

☞ We are glad to learn that the "Pain Killer" is having so large a sale in our city. We have every reason to believe it to be an almost never-failing cure for pain, and a medicine that no family should be without.—*Montreal Pilot.*

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

REDINGTON & CO., and HOSTETTER & SMITH, San Francisco, Cal., General Wholesale Agents. m1m

CRUDE BULLION.

Crude Bullion of any kind, bought at the highest prices. Address, ALBERT ARENTS, 110 Kearny street, San Francisco. 13v18-3m

Blanks for Locating Mining Claims.

We, the undersigned, have this day located and claimed for mining purposes ..... claim of .... feet .... on this vein or lode of mineral-bearing rock or ground, discovered by ....., and known by the name of ..... Lode. Said claim commencing at this notice, and following thence, in a .... direction, such vein or lode, with its dips, spurs, angles, variation and depth, ... feet, with seventy-five feet width on either side of said vein or lode, for the convenient working of the same.

Dated ..... Mining District, ... 1869.

BLANKS of the above form are for sale at the office of the Mining and Scientific Press. Price, $1 per dozen; or 12½ cents per copy.

Avery Pump and Tube Well.

Complete for Use.

The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand. For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Postoffice box 17.

UHRIG & DEWEY,
13v18tf 318 Pine street, San Francisco.

Crucibles.

The Patent Plumbago Crucible Co.,

Manufacturers of all kinds of

Melting Pots, Portable Furnaces,

CRUCIBLES, and other fire-standing Goods,

Battersea Works, London.

THE MORGAN PATENT CRUCIBLES have uniform quality, never crack, withstand the greatest heat without danger; heats more rapidly than any other; change of temperature has no effect on them; stand on the average forty to fifty pour rings.

On hand and for sale by the Agents,

A. S. HALLIDIE & CO.,
1v18-3m9p 519 Front street, San Francisco

PACIFIC

Rolling Mill Company,

SAN FRANCISCO, CAL.

Established for the Manufacture of

RAILROAD AND OTHER IRON

— AND —

Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames

— ALSO —

HAMMERED IRON

Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY Post Office, San Francisco, Cal., will receive prompt attention.

☞ The highest price paid for Scrap Iron. 9v143m9p

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

Machinists and Foundries.

PALMER, KNOX & CO.,

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

AUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hanstrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

The Most Valuable Gold Mine in the World.

The most valuable and extensive gold mine in the world is that known as the "Morro Velho," in Brazil, which is worked by an English company, known as "The St. John de'El Ray Mining Company," an association which was first formed in 1830, for working the St. John d'El Rey Mine. Operations were continued on this mine for two years, when it was abandoned, and the company bought and transferred their works to the "Morro Velho," a mine located about 90 miles north of the former, and some 250 north of the city of Rio Janeiro. Valuable details with regard to this mine are given in the late work published by J. Arthur Phillips, entitled "Mining and Metallurgy of Gold and Silver," from which we collate as follows:

The mine is located in the midst of an exteasive mining region, on the western slope of a range of mountains closely resembling in topography and geology, the western slope of the Sierra Nevada of this State.

At the time of the purchase of the property it had been extensively worked by native proprietors for more than a century, chiefly by open cuttings, and with varied results and reported profits; but a considerable outlay having been found necessary to increase the resources of the mine, the company worked at a loss during the first four years of its possession. In 1839, the returns exceeded the outlay; but the original capital having been exhausted by the losses incurred at the St. John d'El Rey mines, and the purchase of the Morro Velho property, it was found necessary to apply the greater portion of the proceeds of the gold extracted to the extension of plant, and it was not until 1842 that the first dividend was declared.

From that date, with the exception of an interval of eighteen months on one occasion and twelve months on another, during which the working of the most productive portion of the lode was interrupted by a breakage of the pumping and other machinery, the company has regularly paid dividends every six months.

The origiaal paid up capital of the company was $642,000, since which time $540,000 has been laid out in machinery, etc., which with stores on hand valued at $200,000, and a reserved workiag fund of $360,000, makes the total working investment of $1,742,000.

The total value of the precious metals extracted from this mine, up to 1847, was about $15,000,000; tons of ore raised, 1,770,000: total average yield $8.47 per ton. Everything that comes from the mine is recorded as ore, and weighed. It is all assorted, however, and about 24 per cent. thrown aside as second class, and worked separately. From the above figures, it will be seen that it costs $5.64 per ton to raise and crush the ore, leaving a net profit of $2.83. The bullion from this miae carries about 20 per cent. of silver. The profits of the mine are steadily increasing, as is also the yield of the ore, as is shown by the average yearly yield per ton for the eighteen years from 1848 to 1865 inclusive. For the niae years previous to 1857, theaverage yield was 3.98 oitavas per ton. for the next succeeding nine years the average was 4.71 oitavas. This improvement, however, is in a great measure attributable to the improved mode of treatment, which has been gradually introduced into the milling processes.

The company has six mills in operatioa for reducing its first class ore, running from nine to thirty-six stamps each, and aggregating in all 135. The average daily duty of each stamp is 2,666 pounds. The company employs 2,400 hands, about 130 of whom are Europeans.

The sands of the first-class ore, after passing through the batteries, are conveyed to a second series of mills where they are mixed with the second class ore, and again put through other mills, in which are employed 56 stamps.

The formation affording the gold is a strong well defined lode, though irregular in direction, dip and dimeasions; its inclination or underlie has also been found to vary at different depths, and in different parts of its extent. The vein stone is mostly

composed of quartz with iron pyrites, disseminated, more or less regularly, throughout its mass, and the lode is not unfrequently traversed by clay slate and barren white quartz. When pyrites are absent in these rocks, gold is seldom present. Arsensical, magnetic, and ordinary iron pyrites predominate at different points, and in varying quantities; carbonate of lime; dolomite, brown spar, and, very rarely, copper pyrites, are also present in the vein.

In some places the vein is cavernous, and less close in its texture than in others; but where drusy cavities are frequent the yield of gold diminishes. The most productive matrix for gold is a compact mixture of quartz and pyrites, with varying quantities of slate. The average thickness at the present depth, 176 fathoms perpendicular, is 19 feet. The stoping place extends over 807 square fathoms. The enclosing rock is a clay-slate of tolerably uniform texture. The shafts, so called, for the whole of the lode has been excavated from the surface, are carried down at an inclination of about 45°, and the mineral is brought to the surface by tram carriages of a peculiar construction, carrying large kibbes, containing a ton each. The mineral brought to the surface is first freed from slate and other unproductive stone on the spalling floors, and the ore, after being broken to a uniform size, is stamped fine. The rejected slate and quartz is removed by tramways to another establishment, (the second series of mills above mentioned) half a mile distant, and there employed to assist in the further pulverization of the refuse sand from the first stamping, which is re-stamped.

The stamping mills, as is also the pumping and other machinery, are moved by water power. The pulverized ore issuing from the stamp coffers, through finely-perforated copper grates, passes over bullock skins, in the first instance, and lower down the inclined tables, over woolen cloths. The bullock skins are taken up and washed in vats every hour, and the woolen cloths at longer intervals. The concentrated sand resulting from washing the bullock skins is subsequently amalgamated in barrels.

METHOD OF MOUNTING DRAWINGS AND MAPS.—Provide a large drawing-box or a pine table, or the floor of an empty apartment will answer—in fact, any flat wooden surface that is larger than the drawing or map you are about to back. Next you will require a good paste, that will neither decay nor become moldy; therefore, mix good clean flour with cold water into a thick paste well blended together, then add boiling water, stirring well up until it is of a consistency that can be easily and smoothly spread with a brush; add to this a spoonful or two of brown sugar, a little corrosive sublimate, and about half a dozen drops of oil of lavender, and you will have a paste fit to fasten the teeth in a saw. Cut the backing muslin, which should not be too heavy, a size larger than the drawing or map, wet it with fresh water, stretch it out well, tacking the edges lightly round to the board or floor, so as to keep it flat as possible; then while it is damp go over it evenly with the paste, dabbing and rubbing it in well with the brush, but at the same time not too thickly; next damp the chart thoroughly with a sponge on the back; when it looks dull, roll it up on a clean mop-handle or round ruler, press the outer edge firmly down on one end of the pasted muslin, unroll the remainder evenly along the muslin, smoothing it down as you go with a clean, soft, dry cloth; go carefully round the edges, pressing all down; should any air bubbles get between, prick them with a strong needle, and press the spot down immediately; let the whole become gradually and thoroughly dry before you remove it from the stretch; when it is, cut the linen even with the edges, and have them bound round with narrow crimson or blue ribbon. With some large drawings or maps, that are on extra strong paper, a narrow strip of linen pasted round the edges on the back will be sufficient.—*Am. Artisan.*

IN Chicago the copper and brass foundries number 25, doing a business of over $6,000,000 per annum. Twelve thousand men are employed in this industry.

RICH GOLD FIELDS, it is said, have been discovered on the northern frontiers of Norway and Russia.

"IMPROVED SPRING-BED BOTTOM."

(Patented July 21st, 1868.

The undersigned, having purchased the Patentee's interest in the States and Territories of the Pacific Coast, is now prepared to supply Private Houses, Hotels and Steamers with this comfortable, economical and durable "IMPROVED SPRING BED BOTTOM."

Persons going to White Pine will greatly promote their comfort by taking one of these Patent Bottoms, which is secured to a folding Bedstead, the cost of which is less than that of the materials at White Pine.

Warerooom, No. 1002 Market Street,

P. HUDSON, Proprietor.

☞Call and examine. Open until 8 o'clock P. M.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to the public to warrant publication.

Resources and Developments.

PROFIT OF SHEEP RAISING.—E. J. Harding, of Marion County, says the Willamet (Oregon) *Farmer*, of March 15th, about four years ago, purchased 300 head of ewes for $400. Since then he has sold 100 wethers in different small lots; has used mutton largely in his own family; sold last summer to the amount of $500 from the flock; has now sold $1,162.50 worth of sheep, and has 200 head left. In addition to these sums is the amounts, not given, which have been realized from wool. Such results justify Mr. Harding in saying that sheep had proved the most profitable stock to him.

CALIFORNIA FIG CULTURE.—The culture of the fig in California promises to become one of the most lucrative branches of horticulture in the State. The Folsom *Telegraph* says in regard to the fig culture in that vicinity, that Messrs. Humphrey & Berry, of Folsom, are planting out an orchard of fig trees at Mormon Island. They have already four hundred rooted trees in the ground, and are rooting six hundred more. The trees were rooted by J. F. Davol, in Folsom, the slips being from several Smyrna fig trees growing in Davol's garden, which produce a large, luscious brown fig, nearly double the size of the common black, and when cured and boxed, superior to the ordinary fig of commerce. The fig grows splendidly here in the foothills, and already the young figs of this variety are appearing upon the trees.

SOUTHERN RECUPERATION.—According to the Augusta *Chronicle*, the present cotton crop of Georgia will yield from $30,000,000 to $40,000,000 in gold. Mr. Fourney, who is making a Southern tour, writes from Raleigh: "The estimated value of the cotton crop for the last year, including the recent advance in price, is over $520,000,000, a fact which certainly dispels the idea of prolonged poverty, and refutes the cruel accusation that the freedmen will not work. North Carolina alone has raised nearly $15,000,000. At this rate the South will be richer in a few years than she has ever been."

LAND in the agricultural districts attracts increased attention. Buyers are visiting lots and ranches that are in the market, and all the local land offices are full of business. The stream to the southern counties continues, and is overflowing into Tulare Valley. At the Visalia Land Office there was sold in March, over 240,000 acres. There is plenty left, however, the bulk of the even sections in the railroad grant for 150 miles being untouched. In San Francisco and Sacramento, real estate is brisk; at Marysville there is a "fever" still prevailing. At the Olympia Land Office, W. T., there were sold for cash, in January, 6,745 acres, in February, 9,729 acres, about half being for speculative purposes. Real estate in all the towns on Puget Sound has appreciated one half within a year. A buyer from Illinois informs us that land of equal quality and market facilities in that State, can be bought fifty per cent. cheaper than in California.

RESOURCES OF RENO.—A correspondent of the Reno *Crescent*, says that a large field for the employment of capital exists in and about the new town of Reno. Messrs. Fogus & Howell, will have their flour mill in operation in a short time, to be driven by water from the Truckee, along whose banks, within the distance of a few miles one hundred mill sites might be found. The correspondent thinks metallurgical works should be put up there for working the richer or more stubborn ores of Nevada, which might be readily transported to that place from points along the line of the Pacific Railroad. Various kinds of manufacturing operations might be profitably established there. An iron foundry and machine shop will soon be needed, etc., etc. The correspondent adds that a bright future is in store for Reno, the natural advantages of which are greater than those of any other place along the line of the railroad from the summit of the Sierras to Salt Lake.

MINING AND SCIENTIFIC PRESS.—This useful and scientific journal has entered upon its eighteenth volume.

To the scientific, mechanic, and practical men of all classes it is almost invaluable; and we are glad to learn that it is increasing in patronage every day.

The publishers, Dewey & Co., San Francisco, say the present volume shall be superior in all respects to its predecessors.

The terms are $5 in advance, $3 for six months.—*San Bernardino Guardian, March 6th.*

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so, oor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the ages of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited.

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. A. Sumnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

Valuable and Popular Practical Books.

Painter, Gilder, and Varnisher's Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Varnishing, and Glass Staining, with numerous Useful and Valuable Receipts; Tests for the Detection of Adulterations in Oils and Colors, and a statement of the Diseases and Accidents to which Painters, Gilders, and Varnishers are particularly liable, with the simplest methods of Prevention and Remedy, with directions for Graining, Marbling, Sign Writing, and Gilding on Glass. To which are added Complete Instructions for Painting and Varnishing. 12mo., cloth..... $1 50

The Practical Brass and Iron Founder's Guide.—A Concise Treatise on Brass Founding, Molding, the Metals and their Alloys, etc.; to which are added recent Improvements in the Manufacture of Iron, Steel by the Bessemer process, etc. By James Larkin, late conductor of the Brass Foundry Department in Reany, Neafie & Co's Penn Works, Philadelphia. Fifth edition, revised, with extensive additions. In one volume, 12mo..... 2 25

A New and Complete Treatise on the Arts of Tanning, Currying, and Leather Dressing.—Comprising all the Discoveries and Improvements made in France, Great Britain, and the United States. Edited from Notes and Documents of Messrs. Salleron, Grouvelle, Duval, Dessables, Labarraque, Payen, Renc, De Fontenelle, Malapeyre, etc. By Prof. H. Dussauce, Chemist. Illustrated by 212 wood engravings, 8vo..... 10 00

The Miller's, Millwright's and Engineer's Guide.—By Henry Pallett. Illustrated. In 1 vol. 12mo..... 3 00

American Miller and Millwright's Assistant. By Wm Carter Hughes. A new edition. In one volume, 12mo..... 1 50

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address.

Bromide Tunnel Company,

White Pine, Nevada.

NOTICE.

The above Company having been incorporated under the laws of the State of California, has opened a Subscription Book for subscribers to its Capital Stock, at

No. 10 Stevenson Building, San Francisco,

Where full particulars relative to the working of the Company's property can be ascertained. 13v18-1m

SILVER COMET

Mining, Mill and Tunneling

COMPANY,

White Pine District,

NEVADA.

This Company's claim adjoins the celebrated Virginia Mine, on TREASURE HILL.

From its outcroppings and the richness of the Virginia and other mines which have been opened in the immediate vicinity, the prospective value of this mine is not exceeded by any in the District. With a view to the immediate and vigorous prosecution of work in opening this mine, the Board of Trustees propose to sell a limited number of the reserved UNASSESSABLE Shares of Capital Stock at the nominal price of $2 50 per share, the entire proceeds of which will be devoted to developing the mine.

Only **1,000** Shares will be sold at the above named price, and a portion of that number has already been engaged.

In issuing Stock the subscribers will take precedence in the order of their names.

The Books of the Company are now open for subscription at the Secretary's office 417 Kearny street. By order.

12v18-1t IRA G. HOYT, Secretary.

To Quartz Miners.

Having a new system of Amalgamation, styled the

PAUL & WOOD ELECTRIC PROCESS,

And which has been so fully tested as to be worthy of your consideration, I now invite it, relying only on the precious metals produced, cheapness and simplicity of machinery, to gain favor for it.

Parties having mines containing a high percentage of gold and silver, but which cannot be obtained, on account of fineness, or rebellious character of the ore, will do well to investigate. Attention given to communications.

Address, ALMARIN B. PAUL,
408 California st., or Miners' Foundry,
11v18 1m San Francisco.

For Miners, Millmen and Metallurgists.

KUSTEL'S NEW WORK,

CONCENTRATION

Of all kinds of Ores, and the

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **10th, 17th and 30th** of each month that has **30** days.

On the **10th, 18th and 30th** of each month that has **31** days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

April 10th—CONSTITUTION.....Capt. Wm. H. Hudson, Connecting with ALASKA, Capt. Gray

April 17th—GOLDEN CITY.....Capt. Wm. F. Laridge, Connecting with HENRY CHAUNCEY, Capt. Connor.

April 30th—MONTANA.....Capt E. S. Farnsworth, Connecting with ARIZONA, Capt. Marry.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—If desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. J. M. Cavarly, will be dispatched for HONGKONG on MONDAY, April 5th, 1869, at noon, connecting at YOKOHAMA with the steamer NEW YORK, for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our MINING AND SCIENTIFIC PRESS printing office, at No. 414 Clay street. We have no partners in business except the undersigned. White Pine Mining Companies.

The routine, in Nevada mining, is at once to form a Company, including of necessity some responsible names, and to incorporate the same at so many shares and a good round capital, with many nonghts representing the tens, hundreds and thousands that are to be brought to daylight from earth's slimy and ignoble crevices, to reward those who, on faith duly founded, pay out small amounts of cash for stock. While this wealth is but theoretical, and these shining millions are absolutely all yet unborn, in point of fact, notwithstanding our numerous Eberhardts, it cannot be denied that the machinery of forming companies, and of incorporating, is an aid to the development of new and unproved mines. It is unreasonable therefore to condemn a company merely because it has but little to show of results, or to draw a pen ruthlessly through these figures in any given case;—for the latter, to our way of explaining it, must be taken as a poetical expression of a profound sense of nature's underground wealth, and *figurative* acknowledgement of God's munificence in depositing the same under our very feet, where we may get it. We extract the following from the *Bulletin:*

The first companies were incorporated in December last, when 11 filed their certificates. In January this number was more than doubled, 26 companies having been incorporated in that month. February showed an increase of 100 per cent. over January, 52 certificates having been filed. The number of incorporations thus far for March is 80, or nearly as many as were incorporated in the three previous months. The total number to date is 169, representing a paper capital of $246,884,000, divided into 2,330,061 shares. The Consolidated Eberhardt and the Eberhardt Mill and Mining Companies have the largest capitals, namely, $10,000,000 and $12,000,000 respectively. The complete list of White Pine mining incorporations organized in this city to date, so far as we have been able to perfect it, is as follows:

Name.	Incorporated*	Shares.	Capital.
Aurora Consolidated	Dec. 11.	16,000	$1,600,000
Appleton M. M. & Tun. Co	Feb. 18.	40,000	4 000,000

*The names of the Trustees of these Companies can be ascertained from the files of the MINING AND SCIENTIFIC PRESS. December 1, 1868, is the date of the first incorporation.

New Inventions.

BARLOW'S "INSIDE BOILER."—Mr. E. T. Barlow, of No. 116 Third street, has invented and patented through this office, a device which housewives will appreciate, and which he calls an "inside boiler;" the object being to liberate vegetables or meats which have been boiled, from the water used, without the necessity of picking out the material piecemeal, or straining afterwards. It is nothing more than a perforated tin pail, which fits into the inside of the boiler or pot. When lifted out with the matter cooked, the water or soup remains in the pot. A curious fact in connection with its use is that the pot is not so liable to boil over as ordinarily.

A MAGNETIC MOTOR.—The Oakland *News* speaks of an invention in that place whereby a clock is kept in regular motion by means of etationary magnets. The inventor is about to apply for a patent for the same.

IMPROVED BALL AND SOCKET JOINT.—The Nevada *Transcript* speaks favorably of the operation of an improved ball and socket joint, for hydraulic hose-pipe, in use at Sargent & Jacobs' mine, at Quaker Hill, where there are two of them at work. We presume it consists of a device similar to that in use at the San Francisco Water Co's works, near this city, and also to one inventod by Messrs. Craig & Sons, herctofore noticed in these columns. The successful introduction of such an invention as this must prove of much importance in hydraulic mining.

DRILL SHARPENER.—The Sonora *Democrat* has seen a model of what that paper calls a "Buck," designed to save labor in sharpening drills. It consists of an inclined cast-iron plane attached to an anvil block filled with notches in which one end of the drill rests, while the other lays in a notch made in the anvil, thus doing away with the necessity of holding a drill in the hand while sharpening it. In sharpening long drills, it will do away with one man's work entirely. Mr. Hamill, the inventor, has taken the necessary measures to procure a patent.

WINDOW GLASS BLOWERS command about the highest wages paid for labor. Some workmen in the Atlantic States receive as high as from $10 to $15 per day.

To Mining Secretaries.

THE NEW COMBINED

Stock Ledger and Journal,

The most simplified form that has ever yet been offered to the public, is now ready, for sale. This one book is a complete abbreviation of the old Ledger, Journal and Transfer Book, and therefore takes the place of the three.

Stock Incorporations

Now organizing are invited to examine this Book before buying the old style.

JOHN G. HODGE & CO.,
Importers and Wholesale Stationers,
327, 329 and 331 Sansome street, cor. Sacramento.
10w18-10p

Star Creek Mining Company.—Location: Star District, Humboldt County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the twenty-sixth day of February, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Babb, L H	unissued	6	20	$40 00
Bates, A B, Att'y	unissued	10	143	214 50
Davis, Erwin	unissued	2	776	1164 00
Davison, R S, Ally	unissued	9	200	300 00
Fankner, George	unissued	12	1000	1500 00
Leni, Wm M	unissued	1	530	795 00
Levingston, Isaac	unissued	8	108	162 00

Office, 408 California street, San Francisco. mar27

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Machinery.

VARNEY'S
PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**
1vl San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,
Iron, Brick and Wooden Buildings,
SHIPS, STEAMBOATS, STAGES, CARS,
AND FOR ALL EXPOSED SURFACES.

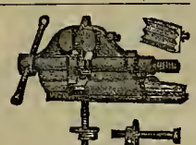
Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on. Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

GEO. T. BROMLEY, Agent,
Battery street, corner Jackson,
24v17-3m San Francisco.

Staudard Milling Machine.



Pipe Vise, with or without Extra Jaw.

UNION VISE COMPANY,
OF BOSTON, MASS.

Extra jaw, and heavy Vises, Warranted for heavy work. New style Wood and Covered Screw Vises, forty styles and kinds; Standard Milling Machines, simple, great capacity, power and strength—two sizes, large, 2,300 lbs; small, 950 lbs. For sale by the trade.
23v16-1y O. H. NOTT, Pres.

BLAKE'S QUARTZ BREAKER!

MACHINERY AGENCY.
W. O. M. BERRY & CO.,
Are the manufacturers' agents for Richardson, Merriam & Co's celebrated
Wood Working Machinery,
Embracing every description of Planers, Matchers and Mortisers, Moulding, Tenoning, Boring, Shaping, Vertical and Circular Re-sawing Machines; Scroll, Railway, Cut-off and Rip Saws, etc., etc. Agents for the Swamscot Co's
Improved Portable Engines,
Warranted fully equal to any in the market; Davis & Furber's Woolen Machinery; Blake's Patent Steam Pumps; Kilburn's and Warren's Turbine Water Wheels, etc., etc.
Orders for Machinery of any kind will receive prompt attention. Machines for special purposes built to order. Send for illustrated Catalogue. W. O. M. BERRY & CO,
8v18-3m 114 California st., San Francisco.

Notice to Miners,
Well-Borers and Water Companies.
M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

SAN FRANCISCO.

All kinds of Edge or other Tools made to order. Particular attention paid to putting in order AGRICULTURAL MACHINERY. Job Grinding and Polishing by steam. Orders from the Country promptly attended to. ☞ All work warranted.
21v17 qy **J. WEICHHART, Proprietor.**

PATENT
Boiler Scraper and Tube-Cleaner.

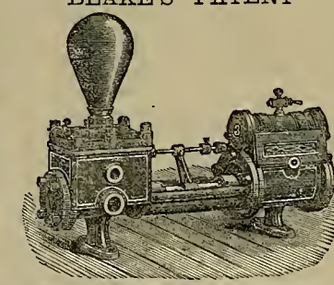
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. H., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!
This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor gets out of order, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at
W. O. M. BERRY & CO'S,

The Perfection of Prepared Cocoa.
MARAVILLA COCOA.
Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluble principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoa-drinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.] "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to the finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must them selves settle the same.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

THE AGE OF STEEL.—The Chicago *Tribune* of Feb. 6th, contains an article upon the rapid changes wrought by scientific ingenuity and mechanical skill, in the extensive substitution of iron for wood, in ship building and machinery. It shows that steel is fast taking the place of iron, being more durable under the wear and tear of friction, stronger to resist strain, more reliable on texture, as a safeguard against accident, and far superior to iron for a great variety of uses. The price of steel has hitherto been a great obstruction to its more general use in place of iron, but it is now produced from iron by a process much more simple, and on a larger scale than heretofore and its price considerably modified. It is shown, however, that even at its former rates, when the first cost was heavy in comparison with iron, that in the long run it is the cheapest for wear, strength and safety. Another objection to its extensive use was its intractability which was a great obstacle in the manufacture of steel, which is now claimed to have been overcome after three years of study and experimenting by Mr. John T. Barr, of Chicago. He and his associates have already demonstrated that steel can be cast in any desired shape or of any required size, and to he absolutely depended upon for strength, durability and uniformity of wear. The discovery is applicable to all kinds of steel castings, and the company have recently been manufacturing steel wheels for railroad cars. They are considered greatly superior to iron wheels in many respects, and may be depended upon to run smoothly and last for a dozen years. It is thought that this new invention will he found to be the one thing wanted to facilitate the substitution of steel for ordinary iron where the ability to stand friction and strain is wanted in its greatest possible perfection.

LEADEN STALACTITES.—A correspondent of the Chicago *Republican*, describing the Berkwait lead mine in Wisconsin, says: "Thirteen beautiful stalactites depend from the low roof, varying in length from eighteen inches to five feet, and in diameter, at the base, from three inches to seven inches. Their proportions are symmetrical, tapering gradually down to a point that will barely sustain a drop of water, as it pauses there a second, tremblingly, before dropping to give place to another. Under the drip of each stalactite is a cone, the several hearing the same relation to each other that the stalactites above do, and containing, severally, perhaps one-fifth as much body as the latter. Both are in an imperfect state of rock formation, and may be shaven down with a knife in granular limy particles, little coarser than the scrapings of chalk. At the bases of each, however, above and below, at their point of attachment, the limestone is very perfect and hard, in a section three feet wide extending entirely across the cave. In what manner the separation is made between the various deposits, or when the necessary change took place, is more than I am able to determine; yet true it is that at one time these stalactites were deeply grooved from the base downward, as they are suspended toward the point or apex, and now these grooves are filled to the surface with pure lead ore, glittering and beautiful. Connected with these deposits and extending over a considerable surface of the roof is an incrustation two and one-half to three inches thick. On the cones below and the floor, however, there is very little mineral. The entire surface of the walls is bathed continually by a slow oozing of water from the crevice surrounding. It is indeed a more beautiful and interesting demonstration than any professor of chemistry or natural philosphy could hope to give."

TO DEODORIZE PETROLEUM.—An English inventor proposes to remove the peculiar odor from petroleum in a manner somewhat similar to that by which palm-oil and other oils have heretofore in some cases been deodorized—by blowing air through them while they are kept heated in a suitable vessel to a temperature of from 170° to 230° Fah. In place of using the air at such a pressure only as is necessary to cause it to flow through the oil, the inventor employs it at a high pressure, especially towards the end of the operation; so that when it enters the oil it expands greatly, thereby becoming intimately mixed with the oil and also cooling it rapidly below the temperature of the air, at which temperature he prefers to commence the treatment, and not to heat the oil.

WOODEN SHIRT BOSOMS.—A Philadelphian has taken out a patent for the manufactnre of wooden shirt bosoms, the material being prepared from that which is now used in papering rooms.

The Hindoo Philosophy.

There is a great deal of suggestive matter to be found in the intuitive poetry of that most ancient of all the world's schools of philosophy, whose principal record is the Shasters. Dr. H. M. Scudder's summary of it as given in his lecture before a very large, and solid, but considerably Presbyterian-looking audience, on Tuesday evening, was very good. He said:

"There were several ancient Hindoo schools of philosophy, and their philosophy always included their theology. One of these schools, taught in regard to five kinds of subjects—God, Matter, Man, Futurity and Salvation. They believed in one supreme being, called "Snt," meaning a passive being, enjoying a perpetual and everlasting condition of rest—a being that was never active, only as the shining sun was active. The sun, they said, shone upon the plant and caused it to bud, bloom, and at last to die. So it was with their god and matter. The passive power of their deity fell upon the universe, and produced, only to bring decay; yet matter, in itself, was somehow eternal. Some of the schools taught that matter was distinct from God, and being distinct, they designated it as primitive Nature. Deity, at certain periods, shone upon this matter, bringing forth a succession of products, and, by regular descending steps, brought forth all the material forms of the universe. At certain periods these forms receded and disappeared, and chaos came again; after which Deity and Nature reposed. Their belief as to futurity and salvation was the well known doctrine of transmigration. They say that before the human soul lie millions of births or deaths. Man might be born and die a thousand million times, either in a human, animal, insect, or even vegetable form, thus experiencing the results of previous transgression, passing through various Hells and Heavens before he reached his final reward in the abode of the supremely blest. And even when virtuous souls reached Hell, they passed through the opposite sides, and continued on forever, for matter required the soul to travel. The eventual emancipation from transmigration was the Hindoo Heaven; and man was on the eve of his approaching exemption when he had learned to act disinterestedly. He who had arrived at that point could never more be changed into fly or horse, or cat, but was on the eve of passing to his reward. If dying before their peace was fully attained, the spirit went to a certain place in the sky, or floated through the elements until the time arrived for it to be born again. When perfection was gained sufficient for the final and perfect Heaven, the contemplative and sequestered soul viewed all things with calm knowledge of perfect wisdom. It grieved at no calamity, nor rejoiced at any success; pain and pleasure were the same. A Hindoo philosopher once said to him that hell was just the place they wanted to go to, for it was on the road they had to travel. One of their proverbs was, "He that knows himself knows God."

In his comparisons of Hindoo philosophy, or poetry (?) with Emerson's ideas, his standpoint was that of a popular Presbyterian clergyman. Emerson had to suffer seathingly. Frequent analogies could of course be traced between them—Emerson and Boston "transcendentalism" being but a poetical version of the modern tendencies of thought evidenced in Kant, Hegel, and other modern German and French ideal natural theologians.

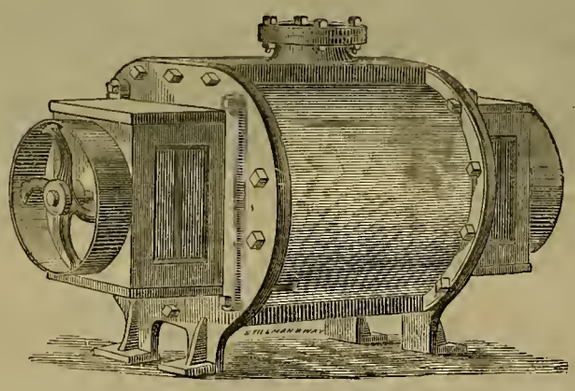
ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

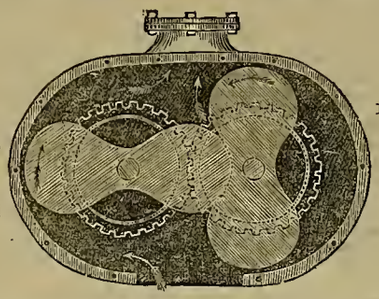
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

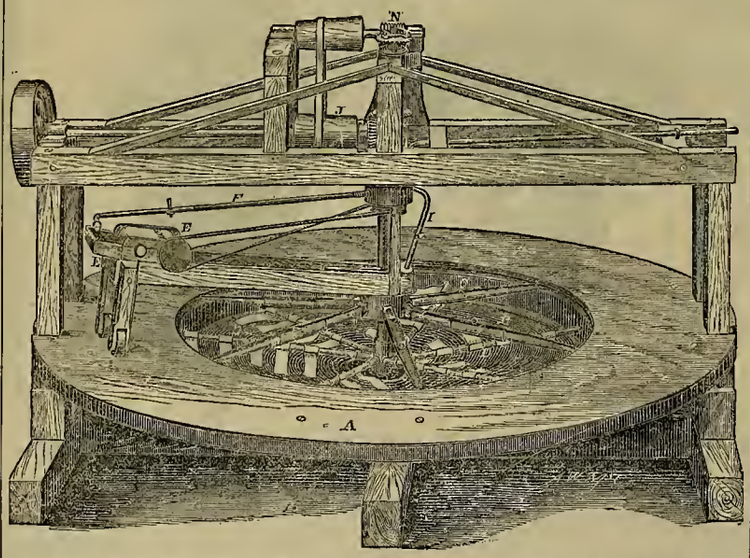
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16-3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.



One Machine, costing about $1,300, is sufficient to work the Sands from 25 to 30 Stamps,

Less power being required than for any other Machine. The attention of quartz millmen throughout the State is directed to the subjoined certificates, and if they desire they can visit the Amador Mining Co's mill, near Sutter Creek, the Eureka Co's mill at Grass Valley, or the Banner Co's mill near Nevada, and see for themselves.

CERTIFICATES:

GRASS VALLEY, Jan. 4th, 1869.—This is to certify, that we have used the Paine, Stephens & Harry Concentrators for over twelve months. They have given us entire satisfaction, and are the best we ever used. WILLIAM WATT, Supt. Eureka Mine.

This is to certify, that we have had in use for the past 18 months one of Paine, Stephens & Co's Sulphuret Saving Machines, constructed by John T. Harry, (called a buddle,) and which operates satisfactorily, particularly so in saving fine sulphurets, and we recommend it as well worthy of use, even where other Concentrators are used above it, as it will pay if there are any sulphurets.
WM. L. TISDALE, Supt. Star Spangled Banner Mine.

NEVADA CITY, Oct. 26, 1868.

Any one wishing to purchase one of these useful machines, can do so by applying to THOS. N. PAINE at Grass Valley, Nevada County, or JOHN T. HARRY, Sutter Creek, Amador County.

GARDEN VALLEY LAND ASSOCIATION.—San Francisco. March 30th. Capital stock, $34,200; 114 shares, $300 each. Trustees: O. B. Huff, Chas. F. Brown, T. W. Myrick, J. Cohn and Wm. J. Grun.

CALIFOLNIA SILK CULTURE Co.—San Francisco. March 30th. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: Oliver Eldridge, Wm. Blanding, W. R. Cluness, Chas. W. Reed and L. A. Garnett.

SILVER MINT S. M. Co.—White Pine, Nev. March 30th. Capital stock, $5,000,000; 10,000 shares, $50 each. Trustees: S. Holliday, M. Kelsay, W. H. Wright, Geo. Waldenrod and John Johnson.

RUSSIA S. M. Co.—White Pine, Nev. March 30th. Capital stock. $4,400,000; 44,000 shares, $100 each. Trustees: Theo. Von Koekull, Theo. Stahl and Jos. Lugebill.

ELECTION OF OFFICERS.—NORTH PACIFIC TRANSPORTATION Co. — San Francisco, March 30th. President, Wm. Alvord; Vice President, Jesse Holladay; Secretary, C. J. Brenham; Treasurer, Wm. C. Ralston.

FLOWERY MINING Co.—San Francisco. March 30th. President, A. K. P. Harmon; Vice-President, J. H. Jones; Secretary, T. W. Fenn; Superintendent, O. S. Carville; Trustees, A. K. P. Harmon, J. H. Jones, A. H. Barker, Chas. Hosmer, M. J. McDonald, T. W. Fenn and O. S. Carville.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

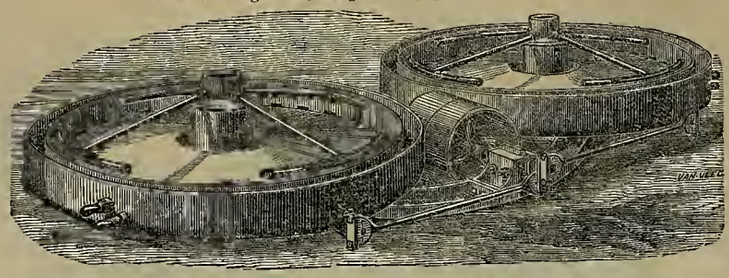
Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.



There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four or them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

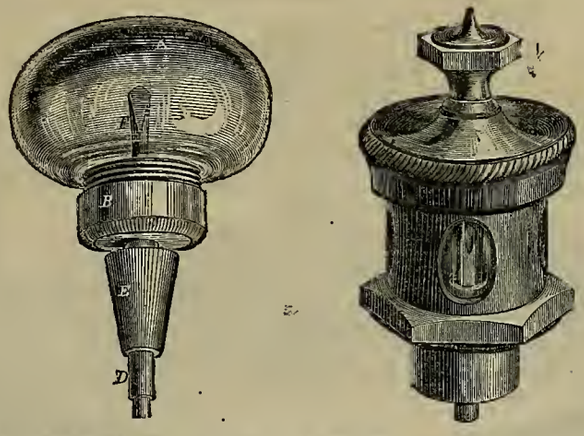
THE STANDARD OF AMERICA.

DREYFUS' PATENT SELF-OILER.



For Locomotives, Marine and Stationary Engines, Fans, Pickers, Looms, Carding and Spinning Frames, Lathes, Saw Frames, Shafting, and Machinery of every description.

A Saving of from 75 to 95 per cent. Guaranteed.

They are composed of a Transparent Glass Cup, mounted in Britannia and Brass, provided with a hollow tube, inside of which is placed a loose-acting solid wire, which acts as a Feeder and Regulator. The wire rests constantly upon the journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion. They are as reliable in winter as in summer, for the reason that the friction produced by the action of the bearing on the wire causes the wire to heat, thereby causing the oil to become limpid. Being perfectly air-tight vessels, the oil will never gum in them, as this has been proven by two years' constant use. They are constructed in a very neat and substantial manner. We spare no pains in making them as perfect as it is possible for them to be made, and GUARANTEE them to give perfect and entire satisfaction.

DIRECTIONS:

Fill the cup full of oil, then screw the cap down air-tight. Place the tube in the oil-hole in an upright position, or upon an angle of 45 degrees. Permit the rod to have a perfectly free action. If you desire to have the oil flow faster, reduce the wire.

REFERENCES:

For the convenience of persons desiring references, we annex the names of a few Manufacturers and Railroad Companies, who are using the Dreyfus Patent Oiler in different parts of the country: San Francisco—Mission Woolen Mills; Pioneer Woolen Mills; Pacific Woolen Mills; Golden State Foundry; Ætna Foundry; Fulton Foundry; Empire Steam Mills; San Francisco Gas Co.; Mechanics' Mills; Bacon & Co., Printers; Bosqui & Co., Printers; B. F. Sterrett, Printer. Sacramento—Union Iron Works. Stockton—Globe Iron Works.

Smelting.

It is the general impression that most of the base metal mines at White Pine will be to a great extent dependent in the matter of profitable operations, on the success of smelting. To the smelting of carbonates of lead and copper plentifully found there in several localities, there can be no obstacle except too low an average of silver in the ore; and there is never any obstacle or difficulty in the smelting of very rich refractory ores, but inexperience and incompetency on the part of the smelter,—who may be an assayer, familiar with his art by rote, rather than with the principles of metallurgy on which his operations are based. A smelter, to be depended upon in the construction and inauguration of new works, must have had years of experience in establishments of the kind, precisely as would be the case with a foundryman, or an iron ore smelter; but with the difference that a foundryman's wastes and failures are not in precious silver. To smelt low grade ores, in a new country, with limited resources and appliances at command, or available only at extravagant figures, is a question of another kind—a problem that even the most competent smelter could fail in solving, or indeed would be likely to fail in, unless he were at the same time somewhat of a financier.

There are half a dozen White Pine smelting establishments on the tapis, all of them we believe *in statu quo*, so far as the production remuneratively of bullion is concerned. The cupola furnace is preferred, with bellows or fan blasts, a good fire-proof sandstone (?) being found in the vicinity of Treasure Hill. Parties in this city are taking steps, we are informed, for the construction also of a reverberatory furnace, with a view to avoiding, by the use of a chimney, the expense of the blast.

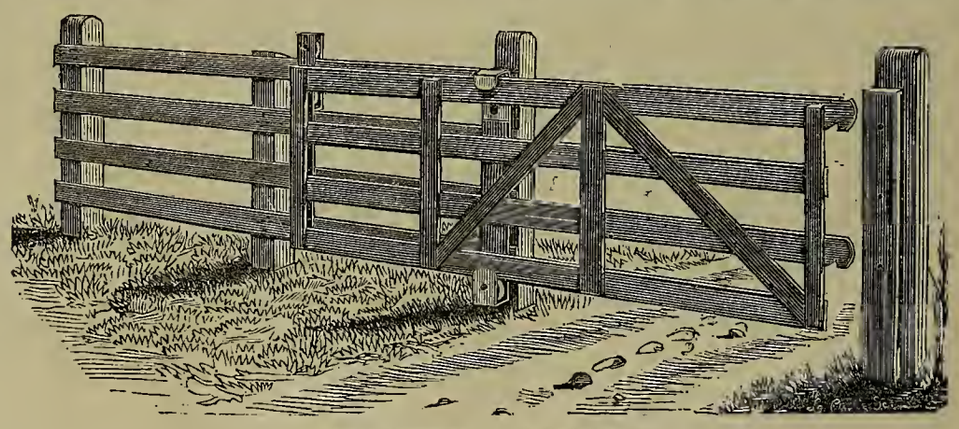
Smelting has been practiced with varied success and in every imaginable kind of furnace, in this city, at Oreana, Adobe Meadow, and Owen's River, Nevada; at Stockton and Cottonwood Cañon, Utah; and at Central City and Georgetown, Colorado; and at several places in Montana. In Mexico there are hundreds of small adobe cupola furnaces, lined with steep, and lime coating above the melting zones, fluxed with alkali (carbonate of soda) principally, and heated by means of hand-bellows,—working successfully on rich ores in the hands of the commonest greasers. Some of the ores treated by these aboriginal metallurgists are first subjected to heap roasting.

We hear of another universal flux,—a new discovery, consequently better than all former universal fluxes put together. Its virtues are vouched for to us, by persons who do not pretend, however, to understand fully the subject—the substance used being kept a great secret. It is probably cryolite, some "silicate of alumina,"—or a humbug. Except in one or two very judiciously managed establishments, it is safe to predict that smelting stock at White Pine will very soon be below par.

IMPROVED CONCENTRATOR.—Mr. Hungerford, of the Hungerford & Prater Concentrator, has recently made some important improvements to the machine with which his name is connected. This improved machine is now at the Pacific Foundry, where its operation, during the past week, has been witnessed and closely observed by quite a number of millmen, miners and others. The modification consists first, in the mode of distribution of the sand as it is fed to the machine. This is now effected by a series of radial arms springing from the feeding fountain in the center, the sand being received through these arms into a circular trough, which also acts as a screen, preventing the access of coarse particles of sand to the table, which seriously interferes with the proper concentration of the sulphurets. The second modification or improvement consists in the application of an automatic feeding arrangement, which is to be employed when the machine is put to work upon sands that have been previously collected in bulk, and which have to be shoveled into the machine, instead of being regularly fed into it, as from a battery. By this arrangement a box may be filled, of sufficient capacity to employ the machine for a half hour or more, and by the stream of feed water automatically moved along from front to the rear of the box, the sand is gradually fed to the concentrating table, slow or fast, as may be required. This automatic feed arrangement seems perfect in its operation, and must save a large amount of labor, in working sands from masses of that material.

Premium Farm Gate.

A substantial and cheap farm gate, which shall combine economy with practibility and neatness is a great desideratum among farmers. Many devices have been patented and introduced; but none as yet appear to have come into very general or permanent use in this State. We give herewith, however, an illustration of a gate, which seems to come about as near meeting the precise necessities of the case as anything with which we have hitherto met. This is known as the "Sear's Excelsior Farm Slide Gate," and has been quite extensively introduced throughout the Atlantic States where it is said to have taken the first premium in every State or County fair in which it has been entered. Mr. D. S. Lusk, of this city, who has purchased the right for building and selling this gate on the Pacific Coast, has already introduced it upon quite a number of farms in Alameda County. He now proposes to dispose of State and County rights.



SEAR'S EXCELSIOR FARM SLIDE GATE.

By reference to the illustration, it will be observed that the construction and operation is exceedingly simple; it may be hung upon any ordinary panel fence—one of the panels of the fence itself being readily converted into a gate. All that is requisite is to procure three or four small and simple castings, when any ordinary workman can readily construct and hang the gate. These gates, when made of unplaned fencing can be constructed at a total cost of from $4 to $5. The gateway being narrower than an ordinary full fence panel, the gate itself is made to "overhang" and thus partially balance its own weight, so that on opening, an expenditure of but little strength is required at the start, when the gate is soon balanced and moves with a very slight effort. For further particulars, apply to D. S. Lusk, or to Messrs. Baker & Hamilton, No. 19 Front street, San Francisco, where a model gate can be seen.

TO BE FENCED.—The track of the Western Pacific Road is to be fenced on both sides of the same from Brighton to Oakland. This is a good move, and one which should be followed by railroads throughout the State.

WHITE PINE SPECIMENS.—A specimen from the Eberhardt recently analyzed by Mr. J. H. C. Bennett, contained 60 per cent. of silver, 20 per cent. chlorine, and 20 per cent of earthy looking matter; the latter consisting of six to seven of arsenic, less than one per cent. of copper, and the rest, or 10 to 12 per cent. of carbonate of lime. This is the ordinary "chloride" ore. Miners in Eastern Nevada make a distinction between "chloride" and "horn silver;" the latter being simply the pure chloride, which looks like horn when not mixed with an earthy gangue.

We have seen a specimen showing chloride interstratified between layers of carbonate of lime, each kind or layer being a quarter of an inch in thickness. The owner was satisfied in knowing that it was "White Pine ore," and was not able to inform us whether the stratification of the specimen as found was conformable with that of the sedimentary rocks of the country; or whether it is a fact that chloride ore at White Pine sometimes shows the phenomenon of vein stratification—of having layers parallel with the general direction of the vein. In either case the specimen was an interesting one, indicating, 1st, either that argentiferous and calcareous solutions alternated; or 2d, that the precipitating reagents were different, and that they alternated in their flow; whether the deposit was sedimentary, or of the character peculiar to veins; or 3d, that the silver solutions infiltrated between the thinnest limestone planes, presuming that these were in position, without permeating or affecting the substance of the lime mineral.

Mr. G. W. Stewart brings us specimens from the Illinois mine, three-eighths of a mile northeast of the Eberhardt, consisting of silver glance or black sulphuret of silver disseminated in granular limestone; from the Mocking Bird mine, consisting of chloride with a few stains of blue carbonate of copper; and a piece of croppings of the latter, resembling chloride, but containing nothing at all. These ores assay from $250 to $2,000, the vein on which these mines are situated being supposed to be the same as that of the Silver Glance mine, and dipping westwardly into the hill.

Bromides are said to exist quite commonly; generally the mineral is nothing more than a brown chloride, distinguished by that name. Bromine has been traced in some of the White Pine ores, as we are informed on the authority of Mr. Richard A. Cochrane, assayer.

Vein Characteristics and Geology of White Pine.

So slight and unsatisfactory bas been the information of a definite character bitherto obtainable on tbis subject, that we welcome the following data (from the pen, we suspect, of Dr. Degroot) as a contribution of greater importauce than most that bave preceded it, descriptive of White Pine and its ore deposits. It is extracted from Bancroft's Guide to White Pine, accompanying the map noticed in another column,—a 12mo. pamphlet of 31 pages :

Towards its northern extremity and in the vicinity of the recently-discovered rich mines, the White Pine chain of mountains separates into several parallel ranges; tbe most western of which consists of the Pogonip Mountain; the central eminence heing designated Treasure Hill; and tbe most eastern Mokomoke Hill, the latter peculiarly constituted and constructed, being composed of silicious and argillaceous rocks, but little disturbed from horizontal in their upheaval. Pogonip and Treasure Hill are calcareous or magnesian in composition; much disturbed and tilted in their uprising through tbe superior rocks and superficial debris, presenting their naked walls and sides of limestone rock, scamed by the sparry stria that indicate the slumhering wealth of their bowels. The limestoue rocks exhibit themselves latitudinally, some eight or nine miles, and longitudiually are coëxtensive with the range some hundreds of miles. They are tbe home of the chlorinated ores on Treasure Hill, and of the base metals on the west. It is yet undetermiued which of these repositories will be ultimately tbe richest, but our practical operators, captivated hy the known riches, and especially by the great facility in working the first-class ores, have in a great measure confined their observatioue and labor to them. In addition to the facility of reduction, Treasure Hill, from its accessibility on all sides, and its proximity to wood and water, has a present advantage that in all probability the future will not disturb. A reference to tbe map will show that the Base Range has not been entirely neglected, while the assays, ranging from $20 to $200, and the abundance of galena and other fluxes, justify the helief tbat the four smelting furnaces now erecting will be successful ventures, and will swell the amount of bullion the coming season. Silica enters into the composition of the veins of the east and north Treasure Hill, but westwardly, including Pogonip, the gangues are calcareous, being calc, fluor, and bitter spar, holding in connection chlorides, carbonates, oxides, phosphates and sulpburets of the various metals.

The disposition of the metals is not so easily recognized, inasmuch as chlorine has altered the usual types of tbe ores, and the assays are not yet sufficiently numerous to cover the ranges of the mineral. Gold, silver, copper, lead, bismutb, and arsenic have been exhibited, but their relations in place to each other has not yet been accurately indicated. In the Eberhardt and coincident mines, silver is found combined with lead, bismuth, antimony and arsenic, making in special sections a rich, eoft, black ore, valuing up to $20,000 per ton. The Virginia and Pocotillo ores are entirely unlike the preceding, though abounding in chlorine, beiug silicious instead of sparry, and having copper and iron in lieu of lead and bismuth. The Aurora and Hidden Treasure ores are lese contaminated, being more purely argentiferous, occasionally yielding native metal. A marked difference is apparent in the ores of the different sections of the hill, caused by various amounts of igneous action. In some places the veins are much disturbed, projecting to the surface large masses of conglomerate and agatized rock, making the ordinary simple reduction impracticable, while in other places the veins are sleeping in a normal state, the only evidence of their oxistence being the sparry stripes tbat furrow the eurface. The paucity of gold in this connection is a remarkable feature; so far as has been observed, it is confined strictly to the gangues and to limited amounts, the sparry assays having failed to give eveu an indication; whether wasted by chlorinatiou or non-existent primarily, the future must determine.

Treasure Hill, exclusive of its outliers, extends five miles north to south, and two and one-half miles east to west. It is a great shaft of calcareous matter, stratified dolomites and schists, crescent shaped at its summit, its northwestern horn heing produced in the Hamilton Ridge, and its southwestern towards Silver Springs. Its hight from the gulches that circle it is nearly 2,000 feet, and from the sea 9,000. Its northern apex is volcanically disturbed, while its southeru crests are tilted westward, at an angle of thirty degrees. Its venous system is gigantic in number, size and wealth, and Potosi and Charñacillo will havo to give precedence to their northern rival.

These and Guanajuato, the richest Mexican miue, are constituted like Treasure Hill, not only in the country rock and vein stuff, hut are essentially the same in mineralization, all producing more or less the chloride ores. This likeness should lessen the prejudices that exist in the breasts of many agaiust tbe lime rocks, and their last misdoubts should be removed by the duration of the Potosi, and the profundity of Charñacillo, whicb, at 1,600 feet in depth, is yet productive. Treasure Hill has the advantage of Potosi in accessibility and temperature, and of Charñacillo in wood and water, and of both in its extraordinary facilities for exploitation. The Hill is nearly encircled by water gulches; its sides are clothed with wood, and it is rifted from top to hottom by great metallic lodes, that course over it in all directions. There is no water, however, *in* the hill, to embarass the miner, who can delve in at the bottom, sides or top, at his discretion.

Ten systems of veins are exhibited in Treasure Hill; in addition to which the great northwest aud southeast courses or belts sweep over, making irregular emissions of vein stuff, that will often compromise tbe regular fissure veins, dislocating some and infiltrating others, and the intervals betweeu them, making a seeming, though false aud unreliable vein. These rocks can be distinguished from tbose of true veins by their transverse structure. A person on Treasure Hill, looking westward on the Pogonip Mountain, will see ribs and ridges coursing down its sides in various directions, but westerly and continuous over the intervening space; and turning to the Mokomoke on the east, will perceive coincident impressions. Advancing to the Pogonip Flat above the Eberhardt, he will see the foot-hills shaped into ridges bearing north and south, and from Hamilton he cauuot fail to note the eame ohvious indications ou the uorth end of Treasure Hill. These are the great northern courses that range over the Hill, contributing largely to its characteristics by their great size and productiveness. To form an idea of the tesselated character of the Hill caused by these multifarious veins intersecting each other, rule the mountain over, creating a lahyrinth that can only he traveled by a rigorous adherence to rnle. The iguorant mind that does uot perceive the venous connection, imagines spurs and angles. Occasionally a "Stoeckwerk" will occur, in which a vein will branch and floor itself; but it is superficial, and in depth it will resume its integrity. Where the rock is refractory or the vein weak, a decisive rupture will not be bad, and the vein will expire between the layers that are partially uplifted, or struggle through the interstices in an irregular manner. Examples of these two modes are frequent in Chloride Flat and many other localities, and induce the most incongruous theories in respect to the metallic arrangement. Veins are rigbt-lined (save where faults occur that are readily noted by the miner), have an invariable dip, not in amount but in kind, and an unvarying parallelism. The constaut nature of the strike, dip and parallelism of veins is a necessity arising from their creation. Break up a body of ice by an underflow of a wave, and the ruptures will be at regular distances conditioned on the thickuess of the ice and the power of the wave, and they will be fouud to have a dip accordant with the force exerted. An earthquake wave flowing from the west would make a north and south ruptnre with a western dip, and the dip would be greater and the rupture more distant, tbe deeper seated the wave. So a north wave would give a uorth dip to its fracture, and at ten miles in the interior of the earth will produce veins more remote from each other than at five miles. The longer the spoke, the longer the felloes of a wheel.

When the imaginary lines representing the several systems of veins are drawu over the bill, do not expect to find each one represented by a vein. The crevice was made hut may not bave been filled, and therefore was closed up making, where this is a general occurrence, a weak and unproductive district. In ordinary, the third or fourth vein of a series will seem to rob its fellows and attain greater bulk, and sometimes all the veins will be surcharged and make au Eherbardt or Chloride Flat, though as in the case of the flat, they are concealed by a refractory surface.

Like other sections of Nevada, where the northwestern and southeastern courses are secondarily affected, remarkable results follow. While not dictating the conformation of the Hill, they exercise a great control over it, and their influence is more especially visible in tbe veins and bedrock of the country. These courses at times give expression to new veiu matter, that fills the intercalated country, and binds the fissure veins together, apparently in a new vein, while at other times, without adding matter, it changes the state of the preëxisteut veins hy baking them with heat, or hy a reinfusion of chlorine. The schists, more than the dolomites, exhibit this influence, by being debilitated even to the point of incineration, and coated all over hy the gray earthy chlorides. It will not he unsafe to say, that, in this conuection, the purest silver ores will he found, as the base chlorides will have been removed uuder the conditions needed to produce this state, —*i. e.*, heat and moisture—while the insoluble silver chlorides will remain.

Railroad Items.

The Proposed Railroad to White Pine is attracting a large share of attention. A gentleman intimately connected with the Central Pacific Railroad has assured the editor of the White Pine *News* that a railroad will certainly be built from some point at or near Elko to White Pine with all reasonable dispatch, and that work will he commenced witbiu a very few months. With the large number of men which that company could put to work as soon as the junctiou is made hetween tbe two overland roads, the White Piue road could he graded inside of three months, and the iron horse might reach there within four months. The importance of such a road can scarcely be estimated. Besides accommodating the vast crowd of travelers that must for years pass to and from White Pine, and greatly decreasing the cost of working the mines there, it would lead to the rapid development of a large area of agricultural territory. Tbe early extension of such a road to the Colorado, which would soon follow, would also give us a connecting link betweeu the two great contiuental railroads—the Central and Southern—at a point precisely where sucb connection would be most needed. The inception and early completion of this road is an improvement of the utmost need.

In refereuce to this road, "Jig," the Gold Hill *News* correspondent, says Carlin, not Elko, should he the point of junction for an interior north and south road. Along the liue would he a belt of fine agricultural land, 70 miles in length, and varying in width from 10 to 30 miles, bounded along the western side by the Diamond range of mouutains, and on the eastern side hy the White Pine range, through a low gap of which Ruby Valley is reacbed six miles from Jacob's Wells.

Oroville and Virginia Railroad.—This company, at the head of which is John Beusley, the well known capitalist, commenced grading near Oroville on the 30th ult. That work would have been commenced sooner but for litigation instituted by another company. The western connections will be with the California Northern Railroad at Oroville, and the Vallejo and Marysville road, with a Sacramento connection at Davisville. The distance from Vallejo to the State line will be 241 miles. Tho road runs up the North Fork of Feather river to a point opposite Quincy, thence through the American Valley to the Middle Fork of Feather River, and thence direct to the Beckwourth Pass. The maximum gradient is 66.7-12 feet; average grade only 34 feet per mile. The greatest elovation attaiued is ouly 4,682 feet above tbe sea.

Tulare and Gilroy.—The citizens of Tulare are jubilant over the prospect of an early connection by rail with San Francisco direct. The Stockton *Gazette* says the prospect is flattering for the success of the new plan for building the railroad from that city up the valley of the San Joaquin. There is every reason for believing that 30 miles of the road will be in operation by the first of Angust next;—while the care which are already ruuning from this city to Gilroy will soon cross over the Coast Range and plungo down into tbe rich and fertile valley beyond. Prudeut business men foresee the value of these improvements and are shaping themselves to take an early advantage thereof. The completion of these roads, both of which may now he considered a matter of early accomplisbment, will at once fill up the Tulare Valley with a large agricultural and mining population. The people now there are already beginning to prepare themselves for the approaching train.

The Western Pacific.—Work upon this road is heing pusbed with vigor, such as has been seen nowhero else in the whole bistory of railroad building, except on the Pacific Coast. The whistlo of the locomotive will eoon be heard in Stockton; while the San Francisco connection is approaching the same point as rapidly as money, muscle and gunpowder can push tho work ahead.

The Northern Coast Railway.—Oregon is fully alive to the importance of her system of railway counections. Sbe wants populatiou east of the Cascade range, and she wants a better outlet to the south for the increasing products of her rich valleys to tbe east of tho Coast Range. To accomplish this, she is addressing all her energies to a connection with the Central Pacific, somewhere in Nevada. To carry out the latter, two routes are proposed, both of which look to a direct connection of tbe magnificent valley of the Willamette with this city—one by way of Humboldt and Petaluma; the other down tbe Sacramento Valley to Marysville. Botb are needed and are eure to be constructed. The rivalry between the friends of the two will effect their construction all the sooner.

California, just now, has a larger interest in the Humboldt than in the Marysville route. A road will soon connect this city witb Eureka; while the Oregonians, in the mean time, will be pushing a main trunk down the Willamette from Portland to a point where the most convenient pass will be found to cross the Cascade range, on the way to connect with the Central Pacific. When both these works are thus far completed, there will be only about 100 miles needed to connect Eureka with Jacksonville, which point will at any time be in easy connection with the Portland and Central Pacific line. The advantage to be derived from such a connection would ensure its early completion, and we should then have a system of roads connecting the two great Pacific States, the importauce of which can scarcely be estimated.

Railroad to Puget Sound.—The movement by Ben. Holladay and others connected with him in the proposal for a railroad from the Columbia River to Puget Sound, is attracting much attention from the largo land owners on the southern shores of that water. Olympia, Stellacoom, and the new towns of Tacoma and Jerusalem are each anxious to secure the terminus of the road withiu their limits, and are all making handsome offers to Mr. Holladay in the way of land. The fact that the road will be speedily built seems to be a matter of no doubt whatever. A glance at tbe map will show at once the great advantage of a railroad connecting the Columbia witb Puget Sound.

To Placerville.—The citizens of Placerville appear to he at work in earnest, to remove the difficulties in the way of the early completion of the Folsom road to that city. The only hindrance to the accomplishment of this much desired improvement, consists of vexatious questions of conflicting interests, which are now in the courts; but which it is proposed to settle amicably, to the end that the pick and shovel may be put into operation. When "John" gets to work on the road, unhindered by the pecuniary quarrels of the white man, the people are sure to he benefited by his labors.

Railroad for Vacaville.—The citizens of Vacaville held a meeting in that place on Friday of last week, to organize a railroad company, to build a railroad from a point on the California Pacific Railroad to Vacaville, a distauce of three and one-half miles. The books were opened and $15,000 subscribed by citizens of the town. The estimated cost of the road is $25,000, which the people here thiuk can be raised and the road running by the 1st of May.

Mechanical.

New Process for Coloring Building Stone.—Dr. J. M. Weisse, of New York, has, after long experimenting, invented a method by which blocks of marble or granite are colored through and through, and that, too, permanently. Heretofore, all plans having this object for their end, have failed; the stone being either stained by them upon the surface only, or the color being changeable with time. The process of Dr. W. is not yet given to the public in detail, but the *Scientific American* says of it: "We are informed that the process is based upon the discovery of a new mordant, which has such an attraction for stone that when a large block has only its base immersed in the solution, it will in a short time become permeated through the entire mass, increasing its specific gravity, and filling its pores so that the absorption of water is rendered very much less when subsequently exposed to the weather, than previous to the operation. When it is remembered that the absorption of water, and its subsequent expansion by frost is one of the greatest causes of disintegration in our climate, it will at once be seen that an important collateral gain is obtained by the new process. Marbles colored by this process in the rough, afterward take a most beautiful polish, and specimens of dolomite polished previous to coloring have their polish heightened by it. We have before us a piece of marble picked up in a common marble yard, of a cheap variety, one side polished the other rough, which has been colored by this process, and which the best judges invariably pronounce to be genuine Sienna marble."

The Radcliffe Process.—*The Engineer* recently visited the Consett Iron Works, and witnessed in practical operation, the production, by the Radcliffe process, of finished bars, sheets, and plates direct from the puddled ball. An example, taken at random from the reporter's note book, is given to show of what the process is capable:

"At half-past three P. M., the first of eight puddled balls was brought from the furnace and placed on the anvil. In four minutes and a half this and seven other balls were welded into a slab weighing 584 pounds. At twenty-six minutes to four o'clock this pile was placed in the heating furnace; at nineteen minutes to four o'clock it was taken out and brought to the rolls; at fourteen minutes to four o'clock it lay on the floor of the mill ready for shearing. Thus, precisely sixteen minutes were occupied in producing the plate from the puddled ball. The weight of the plate before shearing was 574 pounds. It was then sheared to the finished size, 20 feet by 3 feet; thickness, 3-16ths inch nearly; weight sheared, 448 pounds. It is necessary to point out here how much is gained in time, coal, iron, labor, and finally, in money, by the Radcliffe process, as compared with old systems of manufacture? The question here is, what is the quality of the finished plate, bar, or rail? We examined some scores of specimens. Plates 7-8ths inch thick, bent cold to an angle of 90°. Thinner plates bent upon themselves, coiled into a helix, split and bent backwards and forwards, dished up into troughs, twisted and tortured in every imaginable fashion, punched close to the edge—as close as holes would go—yet no symptom of crack or flaw. We have no hesitation in classing the specimens we examined with the very best ship-plates in the market; and yet these plates are produced at a price which has enabled Mr. Radcliffe to take very heavy orders from Dutch shipbuilders, beating Belgium out of the market, and yet leaving a fair profit."

Our readers will recollect the reference which we have before made to this process.

Anti-Incrustators.—A writer in the *Scientific American* says: The genius of inventors has been, for some time past, tasked to discover some means of preventing incrustations in steam boilers. Chemical science, natural philosophy, and mechanics have each contributed many "panaceas" for the attainment of this purpose, but we confess that we know of no remedy applicable in all cases, neither do we believe that such will be discovered. A good chemist, knowing the impurities of any particular water, may, in some cases, be able to indicate to the engineer a chemical agent which will precipitate a portion in a special feed-water tank; but in many instances the chemicals will end by acting deleteriously on the boiler or on the rubbing surfaces of the engine. Heating the feed water by means of the exhaust steam is in most cases inefficient. Successful precipitation at temperatures higher than boiling water, needs the employment of accessory high-pressure boilers, which in the turn become incrusted, and waste as much fuel as the original boiler. Blowing off is unsatisfactory. Surface condensers, as at present manufactured, are too expensive and objectionable from other causes. A hundred "patented" and "unpatented" *anti-incrustators* may individually find useful application in special cases; but none will answer for all sorts of boilers nor for all kinds of water. The matter must in each case be left to the judgment and science of the competent engineer.

Photographic Lenses.—We find the following in *The Engineer:* It is not generally known that a good lens for landscape photography may be made out of a spectacle eye costing less than sixpence. Suppose a spectacle glass of six inches in focal length be chosen, it should be slightly meniscus and nearly plano-convex in form. The convex side should be turned towards the inside of the camera, and the diameter of the lens be reduced to a little more than a third of an inch, by means of a piece of paper perforated by a round hole of the required diameter, and pasted upon the lens. A step of about one-fourth inch aperture should be fixed in the tube of the lens one-third inch in front of the concave surface. A simple lens of this kind will not bring the chemical and visual rays to the same focus, so after focussing, the lens must be pushed one-thirtieth of its focal length nearer to the ground glass. A good photographer can get excellent binocular landscape pictures in a still simpler way, though the exposure will be rather long. Two round holes one-fourth inch diameter, should be bored in the front of the camera, and an old pair of spectacles then be nailed on the wood, so that the centers of the glasses cover the two holes. It is also not generally known to photographers, that those who have binocular portrait lenses may often save themselves the expense of buying a doublet or triplet for copying purposes. The two front lenses of the portrait combinations should be screwed into opposite ends of the same tube, and a small stop be inserted between. This makes a good doublet, giving sharp definition and straight marginal lines.

For Molders in Plaster.—Dr. Hoffman, in the *Journal de Chimie*, recommends the addition of a coat of glycerine to the ordinary soap coating used in molding in plaster. For some time past, the separation of the proof from the mold has become more difficult, from the deterioration of soap.

Effect of Cold upon Tin.—M. Fritsche recently exhibited to the Paris Academy of Sciences some specimens of tin which had undergone a change in their atomic composition during the excessive cold of last winter. Large blocks had become crystallized throughout their entire mass, and had assumed a basaltic appearance. The most peculiar circumstance observed was the formation of large hollow spaces in the midst of the blocks, which in some cases reached the extent of a hundred cubic centimeters. The sides of these cavities were perfectly smooth, with metallic reflections, while the rest of the tin, where broken up into small grains, or into pieces of various sizes, had a dull surface, caused, probably, by oxidation. This phenomenon had been previously noticed in practice, but, with the exception of a case mentioned by M. Erdman, in which the pipes of an organ were found to have been affected in a similar manner, nothing seems to have been published on the subject.

Finishing Taps and Reamers.—"D. B. K."s ends the *Scientific American* his method, which is as follows: "The forgings are got out in the usual way, left to anneal, then centered and turned just sufficient to remove the scale. Then anneal again and turn down to within a thirty-second of an inch or less, of finishing size. Anneal once more and finish in the lathe. If not sprung in turning, the tap or reamer will come out all right when hardened. I have tried this process with taps one-eighth inch diameter and three inches long up to those one inch diameter and two feet long and found it always safe and sure."

James F. Smith has hit upon a simple way of cleaning files filled with work. He simply holds them in a jet of steam under forty pounds pressure. In one minute the files come out "as good as new."

Scientific Miscellany.

Chemical Engineering.—Under this head, Prof. Henry Wurtz has an article in the *Manufacturer and Builder*. We give a sentence from the opening paragraph:

"The time has almost come when few will sneer at the statement that more is to be learned, of a strictly *practical* kind, in relation to the laws governing the strength and durability of materials—an accurate understanding of which is so essential to the weal of man—from the investigations of scientists, than from all the experiments with brick and mortar since the building of the Tower of Babel."

After alluding to the importance of a knowledge of the matters relating to the molecular structure and texture of materials, and the changes which these undergo, in reference to the disasters caused by the sudden breaking of axles, the fall of buildings, or the bursting of boilers, Prof. W. says:

"The new experiment of steel rails, in a climate like ours, whose intense cold is known to destroy the viscosity of steel and leave only its brittleness, is contemplated with foreboding. This leads to the suggestion that no questions require the attention of the investigater more than those connected with the different kinds of consistence of matter, the influence of various agents in modifying the same, and the modes of producing and conserving any desired form of consistence. Graham has generalized all consistence under two heads: the crystalloid and colloid. It seems clear to me that to these must be added the viscous or viscoid consistence, if not still other distinct species. Another great field for the chemical engineer is the preservation from decay, from fire and other destructive agencies, of such substances as stone, wood and other materials used in building, and in the construction of vehicles. It is clear that iron as a material for these purposes is continually disappointing the sanguine expectations of those who do not understand well its inherent defects; and I believe the time will soon come when wood, so prepared chemically as to be incombustible, indestructible, and a perfect non-conductor of heat, will be the almost universal material used in the construction of buildings and vehicles, except, of course, the machinery of the latter."

Eophyton and Eozoön.—The remains of a terrestrial flora have recently been discovered in certain Swedish rocks of Lower Cambrian age. These, so far as we yet know, are the earliest land plants. The discovery of this *Eophyton* is of equal interest with that of *Eozoon*,—the earliest animal organism,—in the Laurentian rocks of Canada. The *Quarterly Journal of Science* says: "A peculiar interest attaches to this discovery, inasmuch as it carries back the appearance of terrestrial vegetation upon the earth's surface through a vast interval of time, no land-plants having previously been known older than the Upper Ludlow beds. The Swedish fossils now discovered appear to be the stems and long parallel-veined leaves of monocotyledonous plants, somewhat allied to the grasses and rushes of the present day. These plants apparently grew on the margin of shallow waters, and were buried in sand or silt, although it is probable that several species, and even genera, may occur in the sandstone blocks which have been examined. They are provisionally included in a single species, to which the name of *Eophyton Linnæanum* has been given."

British Academy of Sciences.—It is reported that an effort will soon be made to unite all the scientific bodies of London into one institution, under the title of the British Academy of Sciences. The *Scientific Opinion* says: "Of course the Royal Society must always stand apart; but it seems to us that a fusion of the other societies would be productive of advantages both to the societies themselves and to scientific progress."

St. Domingo.—"We understand that Prof. W. M. Gabb, formerly connected with the California Survey, and now State Geologist of Santo Domingo, will sail in a few days for the latter country, to commence the work of a topographical and geological survey, with especial reference to the valuable mineral deposits which are known to abound in the island."—*Am. Journal of Mining, Feb.* 13.

Bauxite.—We clip the following from the last number of the *Journal of Applied Chemistry;* "A very important mineral has been found in France, which ought to be looked for among the iron mines of this country. It is called bauxite, after the department in which it was found. We desire to call particular attention to it, as it is probably overlooked or mistaken for a poor clay iron ore. It may be regarded as a hydrated oxide of alumina, in which the iron has been replaced by alumina. The most remarkable thing about it is the entire absence of silica, so that it does not resemble kaolin or potters' clay. Bauxite has already numerous applications in the arts. It is employed in the manufacture of aluminum; it forms a soluble compound with baryta, which enables us to obtain alumina free from iron. By fusing bauxite with soda-ash an aluminate of soda is produced, which has extensive application in calico printing, and which could be employed in the manufacture of glass and of ultra-marine. It is also proposed to fuse it with common salt, as a first step in a new process for the manufacture of soda-ash. A large establishment in Newcastle prepares sixty tons of sulphate of alumina every month from bauxite. They also make aluminate of soda and sulphate of alumina from it, the latter salt being of great value in the manufacture of beet sugar. Very few minerals of recent discovery have attracted more attention than this, and it is to be hoped that deposits of it will be discovered in the United States."

Kjœkkenmœddings in Iowa.—C. A. White briefly describes, in the *American Naturalist* for March, some aboriginal relics recently found upon the banks of the Des Moines River, near Keosauqua, Iowa. Heaps of shells like those of the mollusks which now inhabit the stream, mingled with bones of the deer, the skulls of fresh-water turtles, flint arrow-heads and knives, and fragments of crude pottery, were found. Pieces of charcoal were scattered through the mass. The bed of the stream at this point is especially fitted for the home of these mollusks; and it is evident that this was a cooking and eating place for many years. The examination of the locality is to be resumed during the coming season.

Chemical Substitution of Metals.—"A clean piece of iron dipped into a solution of copper vitriol becomes immediately coated with pure copper. If the iron is left long enough, the blue solution will turn green, indicating that the iron has been dissolved and the copper removed. The coating of copper has become thicker and thicker; and if the piece of iron was large enough, all the copper will be separated. It is plain that the iron and copper have changed places. This is a chemical *substitution*, and, with regard to the copper, a *reduction* from the sulphate to a metallic condition. The reason of this is the greater solubility of the iron. Zinc will thus reduce iron, lead, copper, mercury, silver, and gold; and these, each in the order given, will reduce those named after it. These substitutions were well known to the alchemists; but they erroneously supposed them to be conversions of one metal into another. Thus they supposed the iron thrown into a copper solution to be actually converted into copper, whereas in reality the iron is dissolved, and of course the copper is deposited at the spot where the iron acted upon the liquid."—*Prof. Hinrichs,—in Am. Jour. Mining.*

Manufacture of Soda—New Method. A German chemist takes the double chloride of aluminium and sodium, melts it, pulverizes it, and carries the powder by a blast of a fan into a retort heated to a very high temperature, into which enter at the same time a jet of superheated steam. Hydrochloric (muriatic) acid is formed, and aluminate of soda. The aluminate of soda, decomposed by carbonic acid, yields a very pure carbonate of soda, and alumina, which latter can be used over again. The hydrochloric acid is also a valuable product. The method has been much praised by the German scientific press.—*Gas Light Journal.*

Dissociation.—Henry Deville says that when hydrogen burns in ordinary oxygen there is never more than half combustion, even in the hottest part of the flame, owing to the "dissociative" tension of the watery vapor, which resists it. We diminish this, and increase the combustion, by increasing the pressure.

The Calamity at Gold Hill.

The telegraph has heen largely occupied for two or three days past in transmitting intelligence of one of the most terrihle mining accidents which has ever occurred in the history of mining on this coast. The lives of some thirty or forty men working in the Yellow Jacket, the Crown Point and the Kentuck mines at Gold Hill, Nevada. have heen lost in consequence of a fire breaking out in a drift ahove the localities in which they were working. The fire appears to have heen first discovered at the surface, hy the smoke issuing from one or two of the shafts; hut it had made such headway, that hut very few of those engaged below could escape. Every effort which humanity, skill or daring could devise, was made to reduce, as far as possihle. the effects of the calamity. The first dispatches received in this city created much excitement here, which was gradually intensified as the progress of the fire and the increased extent of the calamity was made known from hour to hour, hy telegraph.

In order to understand the nature of the accident, it should he horne in mind that these men were working a thousand feet or more below the surface in a locality which could he reached only through narrow shafts and drifts containing a large amount of dry timher supports. The fire seems to have hroken out in the Kentuck mine; hut as the level in which it occurred was directly connected with a level at the same depth in the adjoining Crown Point and Yellow Jacket mines, access was as effectually cut off from those mines as from the Kentuck. Each of the mines had its own shaft for entrance and exit; hut all three shafts were out off by the fire in the common level alluded to. A few escapes were made immediately on the alarm being given, but the flames spread so rapidly that at least thirty-two are known to have been completely cut off. Several of those who reached the surface did so at great hazard, from scorching flames and deadly gases, one or more of whom have since died. The wood-work which took fire was the timher and planks which supported the walls and the roof of the drifts, and which is very dry at that depth in those mines, some 800 feet helow the surface.

At last accounts the fire had heen so far subdued that access could he had to most parts of the mines, and up to ten o'clock on Thursday night, twenty-eight dead bodies had heen recovered; four more were known to be missing and possihly eight; one or two had died from injuries received while coming up. The cause of the fire has not yet heen ascertained and probably never will be. The most probable, and in fact the almost only reasonable surmise is that some one had thrust the metal socket of his candle into some dry board or piece of timber, at a distance from whero any one was working and left it there, in such a manner that when the candle burnt down, the blaze came in contact and set fire to the wood work.

The most lively sympathy has heen manifested in this city in hehalf of the bereaved families of the sufferers. The Board of Brokers promptly telegraphed $1,000 for their relief; a henefit is to be given them at the Alhambra Theatre, and several miscellaneous suhscriptions have been raised or set on foot in their behalf. The damage done to the mines is prohahly not very large. The Yellow Jacket is the principal sufferer. Eleven of the dead were married, two of whom left families of five children each.

P. S.—Since the ahove was in type despatches have been recieved up to 3 o'clock, P. M. yesterday, from which we learn that the fires broke out with still greater violence yesterday morning. All hopes of saving any more lives have been abandoned, and the shafts have been closed up, preparatory to attempting to smother the fire by injecting steam. There is now danger that the mines will he entirely destroyed. Additional mystery hangs about the origin of the fire, as some of those who escaped assert that an explosion was distinctly felt just as the alarm was given. The superintendant says that there was no powder in the mine, and that if an explosion occurred it must have been caused by gases coming from a source hitherto unlooked for in a gold or silver mine. The total numher of deaths is now known to he thirty-seven.

Academy of Sciences.

A regular meeting of the Academy was held on Monday evening, the President, Dr. James Blake, in the chair.

Dr. H. W. F. McNutt was elected a member, and L. A. Gould, of Santa Clara, and Captain Edward Pinney were proposed as members.

SPECIMENS AND DONATIONS.

Specimens of stalagmites were presented by W. F. Stewart, of San José, and dwelt upon by Dr. Kellogg in a paper on that subject. Donations to the library were received from Charles Crocker, Esq., Superintendent of the Central Pacific Railroad, consisting of stereoscopic views of rocks and scenery taken 5,000 feet ahove the level of the sea on the line of the railroad; and from various other parties, Bulletins of the Academie Royale of Bolgium, and other scientifio works in French and German; Lyceum of Natural History of New York; Catalogue of reptiles and hutrachians, found near Springfield, Massachusetts; Canadian Geologist and Naturalist; and Memoirs of the Academy of Sciences of St. Petershurg.

DIFFERENCE OF LONGITUDE BY TELEGRAPH.

Professor George Davidson described his operations for tho determiuation of longitude by telegraph. The former mode was hy chronometers carried to different points; also by eclipses or the moon's declinations. After repeated experiments, Mr. Davidson made the circuit hetween San Francisco and Cambridge, Massachusetts, in 82-100 of a second, the distanco heing 7,200 miles. Tho calculations of former moon determinations, were found to have been nearly correct hy the electric observations, the difference heing only one second—equal to a quarter of a mile of longitude.

THE PETALUMA MASTODON

was reported hy Mr. Bolander, who visited the locality of its discovery, to have heen scattered amoug drinking saloons, etc., mainly in this city. He examined the remnants with sufficient care to satisfy himself that it was a true mastodon.

THE COPPEROPOLIS SLATE QUARRIES.—Two specimens of a very superior article of roofing slate have been left with us by Mr. L. Honigsherger, formerly of Copperopolis, now of this city, and one of the owners of the newly-opened quarries hetween Copperopolis and Macarthy's, on the line of the proposed Stockton and Copperopolis Railroad. The entire country is of slate; and visitors to that section during the copper excitements will recall the characteristic sharp vertically-tilted ledges running east and west, from which these roofing-slates are now obtained. Only a few localities have heen found where the quality is sufficiently good for use. It is found that under water level the quality improves. These specimens are from the only mines that are worked at the present time, viz., from Honigsberger's, and Moore's. The latter company has put up a house to facilitate the prosecution of their work. Billiard tahle manufacturers in this city are heginning to use slate instead of marble to form the bed of the tables, alleging that it is equally good, and much cheaper.

The slate in question is perfectly laminated, in large pieces, and is of very fine texture. One of them contains specks of iron pyrites; the other is perfectly pure. The iutention is to cultivate a market in San Francisco. We have not heard any prices or contracts spoken of yet.

REYNOLD'S BULLION SEPARATION PATENT.—We are informed that the patent of John Reynolds for separating bullion bars without granulation, noticed in our last issue, has heen sold to Messrs. Reichling & Sage, the assayers and refiners, at No. 234 Montgomery street, San Francisco. Kellogg, Hewstou & Co. have the right to use it in this State.

The Southern Pacific Railroad—Inauguration Ceremonies.

The Southern Pacific Railroad Co., having put in operation the first section of their road from San José, celehrated the completion of the same on Thursday last. Although the cars have heen running upon this road for over a month, the magnitude and importance of the enterprise was considered of sufficient consequence to merit a formal inauguration, with fitting ceremonies. Accordingly a large numher of invitations were issued to the principal capitalists, merchants, and others, of this city, and to the editorial fraternity, for an excursion over the road. Some fifteen hundred persons, who responded to these invitations, assemhled at the depot of the San José road in this city at 9 o'clock, A. M., on the day appointed, where ample accommodations were provided by the Company. A hand of music was also in attendance. The day was as heautiful as could be wished, and the company, consisting of a large sprinkling of ladies, was as gay and joyful as could he desired.

On arriving at Sau José, ahout one thousand additional persons joined the train, and the whole party proceeded forward ou the new road, which winds, for the most of the distance, through a succession of valleys of nnsurpassed richness and heauty. It was ohserved that on this portion of the road the cars appeared to move more smoothly than upou the San José road, indicating that marked attention has been paid to the character of its construction. At Gilroy the train was recoived hy a great concourso of people, which had beeu gathered in from the town and the region round ahout. Cheers, flags, music, and placards hearing appropriate greetings comprised the demonstrations of joy on the occasion. The people were soon ushered into the Company's immense freight shed adjoining tho depot, where a suhstantial collation had heen provided. After the well sharpened appetites of those present had been satisfied, the assemhlage was called to order hy Mr. Angney, who introduced quite a numher of gentlemen as speakers, among whom were Messrs. George Barstow, W. H. L. Barnes, H. M. Newhall, Dr. Isaac Rowell, and others. The speeches were all well timed and to the point.

Mr. Newhall spoke particularly with reference to the road, alluding to the difficulties attending the construction of this, its first section; hut said that all difficulties were now fairly overcome, and that, in future, its coustruction would go right on, section by sectiou, until it should reach the Mississippi, and make a proper connection with the great system of roads to the East of that river. The remarks of Mr. Newhall was listened to with much attention.

President Newhall, Superintendent Hammond, and other officers and employés of the road, nsed every effort to secure the comfort and convenience of their gnests, with praiseworthy success, especially when we consider the immense company which availed themselves of their invitations. Much interest, we might say enthusiasm, was manifested hy the people all along the line, evincing a general waking up to railroad matters on the part of the people which we are glad to notice.

The excursion and the attendant ceremonies were in every respect a most complete success. The company reached this city, on its roturn, a few minutes after eleven o'clock P. M., without the slightest accident, and rejoicing heartily in so auspicious an inauguratiou of this first section of the great Southern Overland Railroad, which is destined to follow so closely the completion of its predecessor upon the Central route.

THE *Rural Gentleman* is the title of a new agricultural monthly, published by J. B. Rohinson & Co., at Baltimore, Md.

New Patents Issued to Pacific Coast Inventors.

FOR THE WEEK ENDING MARCH 2d.

87,335;—IMPROVED SEAT FOR STREET CARS. Charles H. Foster, San Francisco, Cal.:

I claim the movahle seat B, when hinged at the edge or front of the fixed seat, and provided with a leg or support S, which forms, when the seat is turned hack, an arm to divide the fixed seat, suhstantially as described.

This invention relates to an improved settee or extended seat, such as is used in street cars and other places where a numher of persons are to be accommodated. .The ahove claim fully explains Mr. Foster's manner of arranging the seats iu order to render them capahle of doing-double service.

87,340.—PROCESS OF WORKING SILVER ORES. Henry Janin, Virginia City, Nev:

I claim the use and application of the dichloride of copper (Cu^2 Cl) in tho treatment of all classes of silver ores, tailings, or slimes, whether worked in pans, harrels, or amalgamating tubs, and whether the dichloride of copper bo mado outside and apart from the ores, or whether it be made in the presence and during the treatment of the ores, tailings and slimes, hy the introduction into the pans, harrels, or amalgamating tubs, of the appropriate and necessary chemical ingredients.

This invention relates to an improved process for working silver ores, and is intended to avoid the losses, hoth of quicksilver and the silver itself, usually experienced in the present manner of working.

87,384.— HORSE-SHOE. — William Rickie Watson, Stockton, Cal.:

I claim the ahove described shoe for horses, consisting of a toe-piece, and two heel-pieces, adapted to fit together, suhstantially as described.

It is well known that the usefulness of the horse depends, to a great degree, on the endurance and strength of his foot, heing composed as it is of numerous small bones nicely arranged and adjusted so that when they are in a healthy condition they are capahle of exerting great strength and with great endurance. This part of a horse's foot should he allowed to expand freely, each part occupying its intended space, and when from any cause this expansion is checked, the consequence is that the foot hecomes diseased, and the horse will be crippled in his feet, so that his value is greatly impaired. This is especially the case when horses are shod when young, and allowed to retain the shoes a great length of time without changing.

This invention is intended to avoid this difficulty by constructing the shoe in three different parts, separating the two heel pieces from the toe-piece by means of V shaped joints. These joints are beveled, the toe resting on the bevel of the heel-pieces, thus giving the heel a chance to expand either way.

3,400. — BOOT DESIGN. — Amelia Strang, Oakland, Cal.

I claim the design or model for boots and shoes, herein set forth.

The object of this invention is to provide an improved model or design for boots and shoes, and more particnlarly for ladies' shoes, and it consists, first, in constructing the heel of the shoe in such a manner as to give a solid and firm base for the entire heel of tho foot, while the beauty and finish will he equal to the finest finished heel of ordinary use, without increasing its apparent size; and secondly, in making the shoe more nearly conform to the shape of the foot by manufacturing it wider where the hall or centre of the foot rests in wearing. It also consists in leaving the inside of the sole of greater thickness than the portion at the outside of the foot, and thinning it off gradually towards the toe.

3,402.—DESIGN FOR TABLE SERVICE.—W. K. Vanderslice and Lucius Thompson:

We claim the design or pattern for tahle service, herein set forth.

This is a design for embellishing the different articles of a table service, and we can say from personal inspection of some of the wares bearing the design, that it makes a neat and rich service. Messrs. Vanderslice & Thompson, patentees, have heen long established in this city as practical manufacturers of silverware.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, April 10, 1869.

City Stocks.

In miscellaneous stocks the market remains rather quiet. We note sales of San Francisco Gas Co. stock at $78 50@80, and at the close 100 shares at $79, and ten shares of Pacific Insurance Company stock sold at $127. A dividend of 1 per cent. per month for the past three months will be paid on the 12th instant. The Union Insurance Company also disburse a like dividend on the same date. Their statement, deducting all liabilities and allowing for reinsurance of outstanding risks, shows a net surplus of $102,247. The Occidental Insurance Company will disburse a similar dividend as the above on the 10th instant. The stock of this company has recently appreciated considerably. The second monthly dividend, 1 per cent., of the People's Insurance Co is payable on and after to-day. The Home Mutual Insurance Co. will disburse its first dividend on the 15th inst., amounting to $6,672 on the 20 per cent. of capital stock paid in, which is equal to 2 per cent. on the capitol stock, or 10 per cent. on the amount paid in, for the quarter ending March 31st. We are gratified to see the improved condition of our local insurance companies.

Mining Share Market.

During the past three months, the stock market did not acquire activity as Spring approached, as was the case the year previous, but, on the contrary, activity and prices diminished rapidly. This was due to the non-success of persistent drifting in the deep levels, and until very recently matters looked very discouraging. We are now enabled to record better success, which it is confidently believed will be more general as time advances. Greater activity is manifesting itself, and a largely increased business may soon be looked for.

The fire in the Yellow Jacket, Kentuck and Crown Point is causing a great consternation and excitement in the stock market, and these stocks have declined very much within the past few days.

Since our annual review, early in the present year, in consequence of the repeated evidences of the value of the White Pine district, the minds of a large number of our citizens have been turned into the mining channel, and which will result in more activity and production of the precious metals for the ensuing year than the one past. As far as capital is concerned, the White Pine excitement is characterized with more caution and prudence than is generally supposed from the number of incorporations formed within the past quarter for operating in that district—there being at the present time 169 that are formed for operating there. That the product of bullion from White Pine, as soon as mills can be erected, is going to be highly encouraging, no one doubts; but that all the mines or incorporations are to be paying ones, no one must expect; there are prizes as well as blanks, and time, with development, can only determine which they are. It is conceded, however, by those who are familiar with the eastern portion of California and what is known on the map as the "unexplored region" of both California and Nevada, that the multitude are flowing into what may be considered the great mineral basin of the Pacific, and which extends not only north of White Pine and into our neighboring territories, but southwesterly to the Sierra Nevadas, and thence southerly to the Colorado River.

Already we see material improvements in our mining interests, as illustrated by the dividends of mining incorporations in this city—the last quarter being, in that respect, $159,400 in excess of the preceding quarter, and $397,100 more than the first quarter of 1868. If private institutions have advanced at the same ratio—and we have every reason to believe so—we must regard the prospects of future prosperity in this channel exceedingly flattering. One of the features of the past quarter is the entering among the dividend-paying companies of Storey County, Nevada, of the Occidental, a mine off of what is considered the Comstock range. This mine was located in the earlier days, and for years was considered as unimportant, being regarded as of but little value save as a lime deposit, and from the fact that is was not on the Comstock, until private enterprise finally developed it into an important mine. This fact has given life to other outside locations and we look, during the ensuing months, to developments that will maintain the stability of Virginia City and its surroundings. Of the Comstock companies, we can only note dividends during the past quarter from three, viz: the Yellow Jacket $369,000, Savage, $168,000, and Kentuck, $40,000. The remaining companies, however, have been extracting considerable bullion, pushing developments, and holding ore in reserve for better roads and cheaper transportation. From the Empire, Imperial, Consolidated Alpha, and Gould & Curry there is no very material change as to defining the ultimate results of the Comstock lode.

At the same time that Nevada has taken quite a stride, both in developments and population, California cannot be considered as by any means retrograding in her mining interests. The storms during the past quarter have kept up fully the supply for sluicing and gravel mining purposes, and deposited enough snow in the higher portions of the Sierras to insure a steady supply of water for some time to come. From every quarter we have as encouraging accounts of yield as have characterized the same quarter for the several years past. With the decrease of the richer deposits, there come in corresponding advantages by the way of cheaper labor and labor-saving supplies, such as powder, mechanical drills, etc., which keep the flow of gold quite regular. In quartz mining, the counties of Nevada, Mariposa, Amador and Calaveras, have fully maintained their position as the leading ones of the State. Mariposa, we may say, has materially advanced in her prospects. In each of the above there is considerable activity by the way of new machinery and new systems of working the ores. The lower counties, viz: Tulare, Kern and Fresno, have been less successful, not from the fact that the ore is not good, but that the most of the precious metal carries with it a slight percentage of antimony, or other rebellious substance, which interferes with the collections of the gold by the present system of milling. As soon as this evil is overcome, these counties should send their full quota of gold to market.

During the first three months of the present year, Belcher, Bullion, Raney, and Overman levied assessments, aggregating $156,240, and Kentuck, Savage and Yellow Jacket disbursed dividends amounting to $588,000. These figures of Comstock claims compare with previous statements as follows:

First quarter, 1869—Assessments	$156,240
First quarter, 1869—Dividends	588,000
First quarter, 1868—Assessments	357,500
First quarter, 1868—Dividends	310,000
First quarter, 1867—Assessments	230,780
First quarter, 1867—Dividends	790,000
First quarter, 1866—Assessments	474,800
First quarter 1866—Dividends	90,000

GOULD & CURRY—During the past quarter of 1869, they have experienced great difficulty in carrying the shaft to a greater depth. During the month of March they extracted bullion amounting to $7,500 from the upper works. Telegraphed an improvement in quartz yesterday morning.

SAVAGE—This has been the largest producing mine on the ledge. The bullion returns during the past quarter were as follows: January, $176,100; February, $174,300, and March, $173,800—total, $524,200. The dividends disbursed during the same time aggregate $168,000. A dividend of $4 per share will be paid on and after to-day.

HALE & NORCROSS—This mine continues to look well, and is again yielding considerable quantities of ore. Letters to the 7th inst. state that in running north from the south drift on the fourth level the ore is found to be about ten feet wide, and of medium quality. The 175 level continues to look favorable, but great difficulty is experienced in opening the station on the 300 level. The bullion returns for March aggregate $91,465, with final clean-up from Belden mill to hear from. No bullion receipts in January and February.

YELLOW JACKET—has been one of the most active stocks during the first quarter of the present year, selling at $68 50@93 50 in January, $75@79 50 in February and $66 50@75 in March. Owing to the fire which broke out in this mine on the morning of the 7th inst., through which many lives were lost by suffocation, this stock dropped to $36 on the following day, and closed at $37 50. The dividend of $5, announced as payable on the 15th, has been rescinded. The ore found on the 800-level is reported to be more extensive than was expected. Dividends amounting to $369,000 were disbursed during the first quarter of 1869. We have not yet been advised as to the amount of bullion extracted during the same period.

KENTUCK—sold to a large extent at a decline on the receipt of the news in regard to the fire, dropping to $285, on the 7th, and at the close selling at $290. The bullion for the first quarter of the current year amounted to $201,088. A dividend of $10,000 was paid in January last.

CROWN POINT—The fire which broke out in the Yellow Jacket on the 7th, carrying the draft through the Kentuck and Crown Point drifts, caused this stock to fall to $38 on that day, and to $46 50 on the following, closing yesterday at $34. The bullion receipts for the first quarter of 1869 aggregated $93,130.

The annexed tabular statement of bullion receipts, assessments and dividends, together with the highest and lowest prices of the stock of the various Comstock claims, explains itself. The product of the Yellow Jacket and Occidental companies we have estimated:

COMPANY.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.	Highest Price.	Lowest Price.	Bullion.	Assessments.	Dividends.
	JANUARY.					FEBRUARY.					MARCH.

Total in 1866			671,536	69,700	90,000			804,101					804,101		

CHOLLAR-POTOSI—is in much better request, improving to $188 50 during the past week, and closing at $182. The bullion yield in March is quite large, amounting to $110,392, and for the quarter aggregating $235,961.

IMPERIAL—is quiet, selling at $90@86 during the past week, and closing yesterday at $87 50. Nothing of an encouraging nature has yet been found in the lower levels. They have resumed work in the lower drifts with renewed energy. During the three first months of 1869, the bullion receipts amounted to $123,680.

OPHIR—has been quite active within a few days past, closing at $33 bid. On the 7th inst., the rock had not changed much, but an increase of the clay is somewhat more encouraging. The drift is in 153 feet....CONFIDENCE shows a bullion yield of $18,889 during the first three months of 1869; and GOULD HILL QUARTZ, $17,701 for the same period; OVERMAN, $12,170 during same time.

THE NEW YORK COPPER MARKET.—Winterhoff in his circular of March 5th, says: Copper has been during the entire month completely unsettled by the uncertainty in regard to the tariff. At one time quite a large business was done at 27c. for Lake and 26¾c. for Baltimore, but the market became dull again, and since the final passage of the hill a week ago scarcely any transactions have taken place. To-day's quotation is nominal 26¾c. for both kinds.

WHITE PINE LETTERS AND EDITORIALS continue to be very numerous, the tone of the latter and of half of the former being cooling, but not sufficiently so to have much effect on a fever which must run its course. The letters are made up of an infinite amount of detail. White Pine continues to be "the hub."

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

New Incorporations.

Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

UNION PACIFIC RAILROAD HOMESTEAD ASSOCIATION.—San Francisco. April 3d. Capital stock, $45 000; 200 shares, $225 each. Trustees: H. L. King, E. Worth, W. H. Knight, A. B. Forbes, J. K. S. Latham, Jacob Bacon and N. Heath.

ILLINOIS S. M. CO.—White Pine, Nev. April 3d. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: B. H. Freeman, Jas. R. Garniss, James H. Cutter, E. H. Shaw and David Bush.

CASTLE TRACT HOMESTEAD ASSOCIATION. San Francisco. April 5th. Capital stock, $26,250; 105 shares, $250 each. Trustees: Thos. Kerr, D. Steffens, Michael J. Hopkins, G. Evans, A. S. Gould, F. B. Wilde and Geo. Fritch.

REGENT STREET HOMESTEAD ASSOCIATION. San Francisco. April 6th. Capital stock, $45,449; 125 shares, $355 each. Trustees: E. P. Heald, B. J. Wise, E. W. Schneider, G. W. Chapin, C. J. King, Wm. Koch, Sam. Foster, A. Rosenfeld and James F. Crosett.

MISSION AND PACIFIO WOOLEN MILLS CONSOLIDATED.—San Francisco. April 6th. Capital stock, $5,000,000; 50,000 shares, $100 each. Trustees: J. D. Fry, Donald McLennan and H. F. Williams.

POGONIP FLAT S. M. CO.—White Pine, Nev. April 9th. Capital stock, $2,400,000; 24,000 shares, $100 each. Trustees: John Sime, B. H. Hastings, George L. Kenney, John Taylor, and S. P. Kimhall.

A new Board of Brokers, to be called the CALIFORNIA STOCK EXCHANGE, has been organized for the purpose of dealing in White Pine stocks. President, S. Heydenfeldt; Vice President, Wm. H. V. Cronise; Secretary, Wm. V. Wells; and T. C. Sanhorn, Caller. The number of members is limited to eighty.

REVOLUTION IN THE SHAKER SETTLEMENTS. One of those brown-coated, broad-skirted, broad-brimmed individuals who believe in Ann Lee, celibacy, and the double-shuffle style of worship, recently entered the store of a somewhat facetious druggist in Philadelphia to obtain a supply of medicines for the community to which he belonged. When he had purchased the usual assortment of drastic purgatives, soporifics, mineral poisons, etc., the proprietor of the establishment informed him that he was in receipt of letters from the principal Shaker settlements in the country, stating that the inhabitants were abandoning their former habits and becoming like the rest of the world. The revcrend elder smiled incredulously, but the druggist protested on his honor that it was a fact, and he could not only prove it, but show his visitor the means by which the revolution had been accomplished. Thereupon he placed upon the counter a bottle of Plantation Bitters. The saint didn't see it, but when the man of drugs explained to him that the great vegetable tonic was curing ague and fever in every malarious district, it dawned through his hair, that, medicinally speaking, it was annihilating *Shakerism*.

CANTON FLANNEL, on the authority of C. Muller, of the Spectacle Emporium, in the Russ Block, in this city, is the best material, for wiping the glasses of spectacles.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

ALPINE COUNTY.

From the *Miner*, March 20th:

MORNING STAR.—The drift running from the new shaft to intersect the works at bottom of incline, made the connection this week, the distance being 50 feet. Nothing now seems to be in the way to prevent the raising of ore and the consequent prosperity of the mine.

At the miners' mass meeting on Wednesday, it was voted that undeveloped mining claims be valued at the rate of $5 for each 200 feet, for the purpose of assessment;—although in the opinion of the meeting legally not assessable. It was also resolved that the several mining districts he requested to pass a law pronouncing all undeveloped claims upon which the taxes were not paid, abandoned and subject to re-location.

Chronicle, March 27th:

THE PENNSYLVANIA MINE.—Superintendent Carlson yesterday cut into the ledge, in both drifts, about five feet from the tunnel, striking a body of rich ore, different from that in the tunnel. Four assays have been made of the rock taken out where the ledge was first cut, all of which are satisfactory. Some red rock from the end of the table, thought to be entirely worthless, assayed in San Francisco $12.44; blue ore, assayed by Goldsmith Bros., San Francisco, $22 in silver and $12.50 in gold—$34.50; the clayey ore assayed by Wiegaud, of Virginia, returned $12.58 in silver and $5.34 in gold—$19.92, and quartz assayed by the same party returned $12.95 in silver and $6.28 in gold—$19.23 per ton. The ledge is well defined, from eight to ten feet wide, half of which is solid quartz; and putting the ore at $15 a ton, it is a "big thing," owing to the immense quantity that can be taken out, and the great facilities the company has for mining and working it. Some of the stockholders, after allowing themselves to be sold out and letting others develop the mine, are now anxious to get their stock again, but they are too late. The stock, a short time before the ledge was struck could be bought for $10 a share. Yesterday parties here offered $50, but none can he had at any price.

We learn that the agent of the Tarshish mine has arrived at San Francisco from the East, and will soon arrive in this county to look after the interests of the Schenectady Company.

The strike in the Penusylvania mine has made Mountain stock look up, and those who expect to get it for the assessments at the sale will he disappointed.

AMADOR COUNTY.

Ledger, April 3d:

THE KENNEDY.—This mine has now been running six months. Last week we visited it. Everything about it is of the most substantial character, and the timbers have been put together in the best manner. The engine is a perfect beauty and works to a charm. Everything about the establishment shows a good management. The work at the mine is carried on under the direction of Mr. James Fleming, one of the owners. The "Kennedy" is paying its proprietors a fair compensation for their industry and perseverance.

CALAVERAS COUNTY.

Chronicle April 3d:

We are informed that the Water Co's ditch is now employed to its full capacity, a thousand inches of water being run, which is scarcely sufficient to supply the demand. The Company are digging a branch ditch for conveying water to Red Hill, near the Buckeye. There are a number of claims in that vicinity, known to be rich.

EL DORADO COUNTY.

Placerville *Democrat*, April 3d:

IMPORTANT SALE.—We understand that on Monday last Mr. S. J. Freyer sold his extensive gravel claim, on Reservoir Hill, to B. T. Hunt, of the South Fork Canal, for the sum of $3,600.

TWO LARGE NUGGETS.—On Saturday last, says the Sacramento *Union* of Tuesday, Daniel Leahey and Francis Coyle found two gold nuggets at Gray's Flat, El Dorado county, one weighing 136 and the other 64 ounces of gold, exclusive of quartz.

INYO COUNTY.

LONE PINE.—A Los Angeles dispatch of April 5th, is as follows: Four wagons reached here to-day from Lone Pine district, bringing fifteen tons of argentiferous lead bars from the Union Mine. It is destined for San Francisco.

The Los Angeles *News*, of March 19th, says: Eight tons of silver and lead bullion from the Cerro Gordo mine, Lone Pine district, reached this city day before yesterday. It is estimated by competent assayers to contain 500 pounds of silver to the ton. Fifteen tons from the same mine will be here in a few days.

The *Star*, of March 27th, has these items from Lone Pine:

The mill of Wolfskill & Cervantes, which is to be of five stamps, with four ovens, was delivered at the mine, the Union, on the 13d inst., and a contract immediately entered into to have it erected and in complete working order by the 10th of June....

The Belcher works turn out more ore than they can find wagons to haul. There are four principal mines in the locality, the San Ignacio, the Union, the Belmont and Pedro. The Belmont is turning out better than the others. Belcher is buying the ore at $220 per ton. The mode of smelting is rather primitive. A platform is dug out, on it is erected a pair of bellows, the ore is brought to it, and by hand the bellows are worked, and the lead runs out. In this manner, at the Pedro claim, a bar of pure silver weighing 20 pounds, was run out in a day. The Belcher works turn out from 50 to 60 bars a day. The shaft of the Union mine is down 100 feet.

MARIPOSA COUNTY.

Gazette, April 2d:

BENTON MILLS.—We learn that the Mariposa Co. have the frame of their new 25 or 30-stamp mill already erected at Benton mills, and the remaining work is being pushed forward as fast as practicable. This mill is to be driven by a turbine wheel, and will stand nearly upon a level of the spalling shed, several feet above the highest water. The mill already running is reported to operate well, and the rock is increasing its yield.

NEVADA COUNTY.

Transcript, March 30th:

THE BED ROCK TUNNEL COMPANY VS. BELL ET ALS.—The case of the Bed Rock Tunnel Co. vs. Bell and others, was concluded yesterday, giving plaintiffs the American ground, the defendant the Monte Christo ground and the Railroad claims, and the plaintiffs the Cassin claims. The jury also made a general finding of $800 damages in gold coin for plaintiffs.

SCOTT'S FLAT.—Four companies are at work. In Ashburu & Baker's diggings a cave occurred on Saturday and it will require some time to clean out the mine. Word came down yesterday that eight or ten good men could get work at Scott's Flat and Quaker Hill.

LITTLE YORK.—The Little York Hydraulic Mining Co. is now working three sets of diggings, and after a run of 10 days cleaned up $7,000. There are two or three other companies in that vicinity whose claims are paying first rate....Two Chinese companies are at work. One of them is working the old Buckman claims ...At Remmington Hill there are four companies at work, two drifting and two sluicing. They have just commenced getting water, and their prospects were never better.... At Excelsior Hill, two miles from Remmington Hill, a company of six are at work, and their claims are paying well.

Same of 31st:

NUGGET.—Recorder Slack yesterday showed us a nugget of pure gold worth $297, which was taken from Squirrel Creek, near Rough & Ready.

Same of April 1st:

MINING AND FLUMING.—The Dean Co. have located 10,800 ft. of the North Fork of Deer Creek for mining and fluming purposes. The Cascade Co. have located 12,200 ft. on the main branch of Deer Creek.

April 2d:

NEWS FROM THE FOOT HILLS.—Mooney Flat has been taken in hand by men of capital, and the prospect is encouraging. R. L. Crary & Co. propose to start a tunnel in a few weeks from the face of the Peterson claims on the Sucker Flat side of the ridge, and run through to tap the Mooney Flat tunnel, which is supposed to be fully as rich as the claims on the other side. The miners held a meeting a few evenings since, and elected a recorder. At the same time enough was raised to buy a safe in which to preserve the records of the district. Considerable activity is manifested in the sale and purchase of mining claims.

MORE GOLD.—Frank Morse has just had another clean up of a month's run from his mine, the Hitchen & Larrimer ledge, and the result is $8,000 from 300 loads of rock, an average of $25 per ton.

Gazette, March 30th:

MOORE'S FLAT.—We are informed that the miners of that locality have their claims in active operation, and are making up for time lost by the breaking of the ditch in January.

BANK BLAST.—A bank blast of 304 kegs of powder, was set off in the claims of Weston, Holmes & Co., at Blue Tent, on Saturday last. The tunnel was run 65 ft. into the hill, and the cross tunnel, in which the powder was placed was 140 ft. in length. The blast did good execution, pulverizing a large quantity of gravel, which will be worked this spring and summer.

NORTH BLOOMFIELD.—The Gravel Co. are conducting their operations upon a mammoth scale. Their main ditch supplies 800 inches of water, and smaller ditches half as much more. This is all used by the company, who have four pipes running, each with a 3½-inch nozzle. When their ditch is completed to the English lakes the company will have more water than will be needed, and the surplus will be sold.

Same of 31st:

HUNT'S HILL.—The miners are at work in earnest. The Eastern Co., employing 12 men, are running their mill night and day, and taking out on the average, $1,000 a week. The Gougeye Co., working cement claims, employ 10 men, and take out from $300 to $400 a week. Muffler & Hanley employ 15 men in their hydraulic claims, and are understood to be doing a good business. The times at Hunt's Hill are better than at any period for the last six years.

Same of April 3d:

RICH ROCK.—We saw yesterday, at the Eureka mine, Grass Valley, $5,000, worth of specimens, in about 400 lbs. of hard rock, all taken from the drifts in the fifth level, at a depth of 600 ft. The drifts in this, the lowest level, are now run 150 ft. each way from the incline. The indications are that the mine will hold out for many years to come. The stock in this mine is now valued at $1,000,000. The gross yield of the quartz crushed for the month of March, is $47.000.

GOOD SULPHURETS.—Mr. Deetkin showed us a gold brick yesterday weighing 128 1-10 ozs., the result of the working of 20 tons of sulphurets at the Eureka sulphuret works, from rock crushed at the Idaho mine. The assay was $4,530, and the actual yield was $4,450—or 98 per cent. of the assay.

Grass Valley *National*, March 30th,

EUREKA MINE.—We visited this mine yesterday. The shaft is down about 600 feet. We found the men working in the fourth and fifth levels, stoping up from the fifth to the fourth, and from the fourth to the third. On the fourth level the drifts extend about 1,200 feet, nearly reaching the Idaho claim on the east. On the fifth level they have drifted 300 feet.

THE IDAHO bids fair to be a second Eureka. They are drifting and stoping on the second and fourth levels, and sinking, being now down 480 feet. They were melting, yesterday, the proceeds of the last run of twelve days, the result of which was $14,000.

Same of April 1st:

ALLISON RANCH.—In three or four days 12 stamps will be started at work crushing rock from the croppings of the original working. An immense pile of rock is on the ground, and is said to prospect well. The pumps will start in about two weeks.

Brown Brothers, near You Bet, last Saturday, after a run of four days with eight stamps, cleaned up 35 pounds of dry amalgam, which at $10.50 per ounce, avoirdupois, amounts to $5,880. The claim is on the celebrated Blue lead.

Grass Valley *Union*, April 1st:

HOWARD HILL MINE.—We saw some specimens of quartz yesterday, rich in gold and sulphurets, from the Howard Hill mine, better known as the "Lucky." This mine has been worked for some time by a company of practical miners, under a lease. Their work has been done altogether in the old levels, the lowest of which is 280 feet below the surface, and from which they have been taking out excellent rock. Their run for two weeks, to the 31st of March, was 300 tons, which paid $30 per ton.

The West Eureka Co. have made application for a mineral patent to their claim.

Same April 4th:

WILLIAM PENN MINE.—This mine continues to look well. The shaft is now down 61 feet. The ledge is two feet thick, and has been gradually widening all the way down. The walls are very regular. The rock taken is first class, showing well in free gold, sulphurets and galena, and fine gold intermixed with the sulphurets.

PLACER COUNTY.

Auburn *Stars and Stripes*, April 1st:

TO BE SOLD.—Constable Higgins advertises for sale the Black Lead, Bald Hill, Lone Star district, together with all the appurtenances, to satisfy a judgment and costs amounting to $274,88.

PLUMAS COUNTY.

Quincy *National*, March 27th:

ARGENTINE.—We understand that the placer miners are doing first rate. The Knisely & Co. quartz mill and mine in that section has changed hands, and will commence crushing rock shortly.

North Fork correspondent of same:

Balliett & Co. are still working the old Bamboo. Bryan & Boston are digging a race to turn the river at the lower end of Bamboo Bar. Perley & Bowers got their hydraulic running, at Sunnyside, last week. They have a large piece of deep ground. The old Dutch Hill Co. are putting a pump in their tunnel, to run by water. They ran a bed rock tunnel, but at a distance of 800 feet the rock dropped off. The boys followed it down about sixteen feet, and found good prospects all the way. Ferguson & Wagoner have been running a bedrock tunnel all winter, and broke through last week. They are getting very good prospects. Mechlin is taking pay dirt out of his tunnel on Barker Hill, for carting in the summer. He has a piece of ground that prospects well.

SISKIYOU COUNTY.

Yreka *Union*, March 27th:

CANAL GULCH.—Frank Riley and others have a quartz ledge on Canal Gulch which they are prospecting. The rock, where uncovered, prospects rich. They are sinking a shaft to strike the ledge at some distance. If they find it as good as where it is opened, they will erect a mill. The gold is not visible to the eye, but it is impossible to find a piece but what prospects well when pulverized.

SHASTA RIVER CANAL.—The Big Ditch is now carrying water to its full capacity.

SONOMA COUNTY.

SILVER EXCITEMENT AT PETALUMA.—Considerable excitement is said to exist at Petaluma, caused by the discovery of silver ore in the Sonoma range of mountains, about seven miles from Petaluma. There had been previous discoveries of cinnabar and coal, and last week, silver ore, assaying $10 to the ton, was found in considerable quantities. Hundreds of acres were at once staked off in claims, and the rush for locations is described as being very great.

TRINITY COUNTY.

Journal, March 20th:

CANON CREEK.—Baumgartner & Co. have picked up as much as $100 in one day while ground-sluicing in their claim at Tyson's old place. They will take out $15,000 this year. One week Kellenger & Garwood picked up $500 in $1 and $2 pieces, also, while ground-sluicing. Mathewson & Murphy expect to make $50 per day to the hand, and Adam Berger is believed to have the best claim on the creek. There has been no lack of water.

Same of April 3d:

MINERSVILLE AND VICINITY.—Mr. C. M. Mead's claim has paid well this season, and he has just completed a ditch, of 1,200 in. capacity, conveying water from the East Fork to his diggings at the mouth of Italian Gulch....Mining is being vigorously prosecuted on Little Mule Creek. Several companies are at work....Wheedon, Van Matre & Co. have started in at the lower end of the bar in which the rich prospects were found, and are bringing up a drain ditch that will enable them to work the creek to the best advantage....The Buckeye boys are busy.

RED HILL.—Lorenz & Jacobs cleaned up last week, after a run of three weeks, with three men, the sum of $3,200. There is plenty of such ground, not only at Red Hill, but in other parts of the county. What is needed is more water and men determined to work.

Douglass City correspondence of same: On the west side of Weaver Creek, Hinds, Swift & Dixon are working the old abandoned claim of Flynn & Sudworth, with good results. The gold is light and flaky, and could not be saved by the old process. The boys have their claim rigged up with all the appliances for mining—hydraulic, reservoir and under-current. They saved about one-eighth of their gold in the undercurrent, at the first clean up, yet found that some had passed over the screen and settled in the boxes below.

On Smith's Flat Paulson & Co. made a clean up, expecting little, and were agreeably surprised to find $1,100 in the flume. Smith's Flat has "seen its best days." All the claims but two have passed into the hands of Portuguese, and are pretty well worked out.

There are but two claims running on Union Hill—McWilliams Bros., and our own. The McWilliams boys expect to average $1,000 a month during the mining season.

TUOLUMNE COUNTY.

The sixth trial of the Table Mountain Tunnel case, commenced in 1861, has ended without result, the jury failing to agree. The *Democrat* says: The costs incurred have been enormous, and probably exceed the value of the ground in dispute. In the meantime the tunnel, some 4,500 ft. in length

in Table Mountain, has gone to decay, the timbers have rotted away, and it has caved in many places, ruining it for future use. This case has lasted longer than any other mining suit ever instituted in this county, and its final termination will be hailed with satisfaction by court, counsel and witnesses.

YUBA COUNTY.

Marysville *Appeal*, April 1st:

About to Suspend.—We understand that the owners of the Jefferson mine, at Brown's Valley, have resolved to suspend operations, the mine being considered as worked out. The stopping of the pump has necessitated a larger pump in the Pennsylvania.

Same of 3d:

The Pennsylvania.—Notwithstanding the $2 assessment, the mine has rich rock, and there is every prospect of better success after the introduction of the new 10-inch pump. The mill ran less than a third of last month, and about $2,000 were realized.

A Dividend.—We are told that the Jefferson mine which closed up on the 31st, declared a dividend of $15.

ARIZONA.

Prescott *Miner*, March 20th:

Big Bug.—Mining items are scarce this week. We have reports but from two camps—Big Bug and Lower Lynx Creek. At the first named place, the companies at work in the old Mexican Gulch, have been doing well. We are informed by a man who has worked for one of the companies, and who came to town this week, that on an average the diggings have paid about $8 a day to the man. They are now sluicing at the lower end of the gulch, where they frequently find, on the bedrock, pieces of very rich quartz. A short time ago they found a piece of gold quartz that weighed $12. The heaviest gold and richest pieces of quartz are found in a streak or stratum of blue gravel. The companies estimate that it will take them three years to work out the gulch.

Lynx Creek.—The news from Lynx Creek was furnished us by Capt. Shoupe, and is to the effect that his own claim and the claims of Jackson, Lovejoy & Co., were paying exceedingly well. Jackson & Co. had not cleaned up when he left, but Mr. Lovejoy informed him that the bottoms of the sluices were perfectly yellow with gold. Mr. Shoupe's own claim has paid about $10 per day to the hand. A piece weighing $6 had been found, was brought to town by him and presented to Major Clendenin.

Wickenburg.—From parties who arrived here recently, we learn that Messrs. Reese & Krauso were enlarging their mill-house and placing a new 5-stamp battery alongside the old one. The Vulture Co's 20-stamp mill was working away, and as usual, paying.

Some 25 or 30 Mexicans are working the old placers at Weaver, and a party of Americans are engaged in sinking a shaft on a bar in Antelope Creek.

Sterling.—The latest news from San Francisco regarding the intended operations of the Sterling Mining Co., is to the effect that $100,000 of the capital had been paid up; that Mr. Borger was coming back to take charge of the chlorination department, and that a new general Superintendent would be sent out.

IDAHO.

Silver City *Tidal Wave*, March 30th:

The Baxter boys have finished running their 200-foot level and are again sinking. They propose to commence stoping in three levels in the spring—one at 100, one at 200, and one at 300 feet. The mine maintains its richness and size admirably as they go down.

The Rising Star mine and mill, under Capt. Hall's management, continues to pan out beautifully.

Shep. Osborn, while encamped near Carson Ranch a short time since, discovered a bed of what is pronounced by the blacksmiths very good coal, about 12 miles from here in the foot-hills, bordering Snake River Valley. The deposit is twelve feet thick, and has the appearance of being extensive.

Stepping into Blake & Co's assay office on Thursday evening just as they were finishing up their day's work of melting and assaying, we took note of the figures on four large silver bars, yet warm from having been tried in the furnace and not found wanting, and ascertained the assay value to be $8,529.05, besides one bar that was not stamped, which would raise the amount to nearly $10,000.

MONTANA.

Helena *Herald*, March 8th: The reported discoveries of rich gold bars of Gold Creek, which we published last week, is confirmed by several parties who arrived in this city from that vicinity recently. They report that bar diggings of considerable extent and richness have been found there, which has had the effect to inspire those interested with the greatest confidence.

A correspondent sends us a description of the "Whitlatch Park" mine and its present position, which we condense as follows: It is about four miles from Helena, and is owned by Messrs. Whitlatch and Walker. It includes 320 feet; two inclines, each 230 feet in depth on the lode, a shaft 70 feet deep, and a cross-cut connecting the bottom of the inclines. The vein at the surface is 20 inches thick; at the bottom, 7 feet. About 1,000 tons of ore is out and on the surface. Some 400 tons has been crushed in an imperfect mill, and averaged over $60 to the ton. The "Philadelphia Enterprise" claim, on the same lode, which has a 30-stamp mill, cleared up during 1868 one million one thousand five hundred dollars. The stratum of decomposed rock underlying the "Park" is very rich. Mr. Whitlatch obtained $65 from four pounds of it pulverized in a mortar; there is, however, not more than one ton of this very rich rock to a thousand of the average ore.

NEVADA.

HUMBOLDT.

Register, March 27th:

Another Quartz Mill.—Recent developments on the Sixty-nine ledge are favorable. Arrangements are being made for reduction works of a capacity to crush and amalgamate ten tons a day.

Work on the Seminole is being prosecuted day and night. The present length of the tunnel, from the point where ground was first broken, is almost 340 feet.

The Evening Star.—We learn from Fred. Wright, of Oreana, that work will be commenced immediately on the Evening Star mine.

The Silver Mining Co. are about to increase the capacity of their mill sufficiently to enable them to crush 20 tons of ore daily.

Work has been resumed on the Tallulah ledge, in Dun Glen district.

Winnemucca correspondence, *Gold Hill News:*

Pride of the Mountain.—Four years ago Buck & Kunkle began work. They have shipped 30 tons of ore., and are now hauling to the depot their second shipment of 70 tons. Horn silver is plentifully spattered throughout the ore, and rich, black sulphurets abound. On the same lode, another company have in their incline, down about 60 feet, a fine looking lode, two feet thick, full of excellent ore. Two other companies are just starting in, and we have every prospect of being a busy camp this summer. We don't fool with anybody's mill, but send our ores to Swansea, where we get their full value.

Battle Mountain is still giving out bullion at the rate of $200 per ton. The Little Giant lode don't appear to stop in the original claim, for the extensions are turning out fine ore.

Golconda.—Negus is working away with an average result of $50 per ton. He has a three-foot vein at the present level.

Unionville.—Fall & Co. and the Consolidated Co. are taking out fine ore. The ore worked at the Consolidated Co's mill, report says, works about $48 per ton, and the tailings assay $100. Fall & Co's mill is said to be working out $30 per ton from the same class of ore.

Alpha.—The owners have a shaft down 200 feet, and a lode of mineral 10 and 12 feet thick all the way down. A tunnel is now being run to connect with the bottom of the shaft. This tunnel runs on the lode most of the way, and is designed for a working level. Five feet of the vein will pay $150 per ton. The owners are going to take out this rich strike, and ship it to Europe.

The Grant is an old mine under a new name. This winter they started in, drifting from the bottom of their shaft, and in a short time cut a body of ore that astonished the natives. It is rich. A short time ago one of the owners took a notion to visit his old home, and just to show the "suckers" what kind of stuff grew out in this country, he took a hand-saw and sawed off a chunk of ruby silver. I am told that the owners challenge the State for the production of a specimen equal to one they will bring from the Grant.

The Sheba is again to wake up, after a sleep of over four years. Joe Orgau has leased it, and begins operations immediately.

REESE RIVER.

Austin *Reveille*, March 31st:

Mill to be Opened.—We learned this afternoon from Mr. Curtis, the Superintendent of the company, that the Manhattan mill would be opened to-morrow morning. There is a large supply of stunning ore on hand, and more coming.

Pluto is the name proposed for the new district taken off from Eureka. It is about 75 miles east of Austin. The ore is found in isolated deposits, as in White Pine. Locations may be made by the square, as well as by linear measurement on the vein. Assays of rock show from $100 to $500 per ton.

Belmont *Champion*, March 27th:

We learn that the mill of the Silver Peak and Red Mountain Co. is working steadily, with good results. Laborers are very scarce in the district, but the company have 2,000 tons of rich ore on their dumps, and the mill will not be allowed to stop.

The rich ledges of Reveille are beginning to attract the attention of prospectors. Six weeks ago there were not a dozen men in the camp, while at the present time there are from 80 to 100. N. Brobant, an old resident of the district, brought into Belmont, last week, a small lot of bullion, worth $487, the result of six days' run of eight hours a day, of a small arastra, driven by horse power, on ore from the Green Gage and Pearl ledges. The ore from these ledges pays, by the wet process, $200 per ton. Barnes & Co., Capt. Baker & Co., Hammond & Co., George Nichols, H. L. Hawes and Babb & Co. are busily at work taking out very rich ore.

At the Enterprise mine, there is now a considerable amount of ore upon the dumps, which will work not less than $300 per ton. There are but 600 feet in this claim and Alexander McKenzie owns a controlling interest.

Sale of the Arizona Mine.—We are informed that Len Martin has sold his Arizona mine, in this district, to James Stewart and Alexander Kennedy. The gentlemen who have purchased this mine went to White Pine some months since, located ground, and have sold a portion of their claims, bought the above mine, and will immediately commence the development of it.

WASHOE.

[In the Stock Circular, in another portion of this paper will be found late mining news from this district.]

Territorial Enterprise, March 3d:

Flowery.—There will be much prospecting in Flowery and in the range of the Occidental mine northward this spring. Miners will look for chimneys along the croppings; not, as in 1860, run tunnels one to two thousand feet to begin with.

C. Wiegand, assayer, writes that he suspects the rumor of the Empire City strike, (east of Carson,) is unfounded; and that the discoverer was tricked by some practical joker who thrust a piece of gold ore into the forge where he did the burning.

Same of March 31st:

Savage.—The body of ore struck in the North Potosi chimney is one of the finest ever found in the mine.

Yellow Jacket.—A fine body of ore was struck day before yesterday in this mine, on the 800-foot level.

Same of April 1st:

We were yesterday shown some beautiful specimens of copper, from the Wheeler mine, Pine Grove. The specimens contain a large per cent. of gold. Besides the copper specimens, we were shown from the same mine a piece of quartz literally filled with free gold.

Cole.—The company are having a lot of ore reduced at the Summit mill. It is being worked through one of S. Howland's patent grinders.

Sacramento Co.—The Sacramento Co. are again at work. Their ore is being crushed at the Summit mill.

April 2d:

Chollar-Potosi.—The drift at the 1,240-foot level has penetrated about 170 feet from the incline. The rock is not quite so hard.

Same of 3d:

Sierra Nevada.—The Sierra Nevada Co. yesterday cleaned up 80 pounds of retorted gold bullion, worth about $15,000. This yield was the result of a run of 14½ days. The yield for the present month has been over $20,000. The works will be shut down for some four or five days in order to mend the boiler.

Ophir.—The Ophir Co. are making good progress with their drift to the westward from the bottom of their shaft. The rock encountered is becoming softer and more moist.

Yellow Jacket.—The body of ore struck on the 800-foot level is even more extensive than was at first expected, and assays from $80 to $900 per ton.

Gould and Curry.—The shaft was freed from water last evening, when sinking was resumed.

Same of 4th:

The American Mine, the next south of the Overman, will on Monday or Tuesday, begin taking out ore for milling.

Hale & Norcross.—The shaft of the old works has been retimbered to the 300-foot level, and this week they will begin the work of taking out ore on this level. At present about 34 tons of ore per day, that will pay $30 per ton, are being extracted on the 175-foot level.

Occidental.—A Virginia telegram of April 5th, says: This morning the Occidental struck very rich ore in the bottom of the winze, 140 feet below the floor of the upper tunnel, and 35 feet below the water level.

NEW MEXICO.

The White Pine *News* of March 20th, says: "It is said a silver mine has been discovered in San Andres cañon, near La Mesilla, New Mexico, with a ledge 50 feet wide, that can be traced for miles, and that pays $1,700 per ton, with very poor working. We will believe it when the mine furnishes as much silver as does the Eberhardt."

OREGON.

Dalles *Mountaineer*, March 19th: Letter from Cañon City: During the late fine weather prospecting has been going on here briskly. Captain Borland has struck a good prospect a mile above town in the bank of Cañon Creek. He gets one dollar to the pan and has not found bed-rock. Berry Bros. & Co. have struck a good prospect on the upper end of the Penfield Mill Flat Claims.

John Campbell's bed-rock flume is nearly completed. Campbell's claims are thought to be the best on the Creek, and in a short time he will be taking out plenty of money.

The Prairie Diggings' quartz mill is being pushed ahead rapidly to completion.

WASHINGTON.

A correspondent of the S. F. *Bulletin*, March 31st: For several years gold has been known to exist in the Black Hills, some twelve miles west of Olympia, but it has been believed not in sufficient quantities to pay for working. For some two months past an old and experienced placer miner, known by the name of "Texas," has been prospecting the Hills, and he has recently demonstrated to a party of gentlemen who visited his camp that from $3 to $5 per day can be made by an ordinarily industrious man with either the sluice or cradle. The gold region is extensive, and several thousand men can find employment. "Texas" reports finding gold-bearing quartz, but its richness has not yet been tested.

WYOMING.

New Gold Discoveries.—A rumor was current in Cheyenne on the 15th ult., that rich gold discoveries had been made on Green River, about 200 miles below the railroad crossing of that stream. It is also stated that the remains of men and horses, apparently a party of prospectors, were found in the locality of the reputed gold fields.

Steam Jets to Clear a Vessel from Water.—A correspondent of the London *Times* proposes to lift water from the hold of a vessel by means of steam jets, supplied from the boiler. The idea is a good one; but is not new, as the *Times* might readily have learned by consulting the back numbers of this paper, in the columns of which it was fully described some two years ago, as "The American Steam Syphon Pump." Such an arrangement would be easily and simply available in case of the shipping of a heavy sea, or when any other extraordinary surplus of water was to be got rid of. In such case, the engine might be for the time disabled; and pumps to be worked by it would of course be useless. The jet would be fully capable of accomplishing the work at once, being always ready for work as long as the fires are kept up.

Gold Nuggets.—Some very large nuggets of gold have recently been found in Australia. At Gympie, in Queensland, a 700-ounce nugget was taken out of the Golden Bar claim. At Berlin, near Inglewood, one man obtained, in a couple of days, 480 ounces of gold, comprising one nugget of 286 ounces, and a number of smaller ones. At the same field two nuggets, weighing respectively 225 ounces and 175 ounces, have also been discovered.

Seventeen thousand men and sixty dredging machines do the work on the Suez Canal.

The reports of the discovery of valuable diamonds at Cape Good Hope are confirmed.

San Francisco:

Saturday Morning, April 10, 1869.

Notices to Correspondents.

P. S., Antioch.—The word Pampas means the same as the Spanish word *llanos*, as applied to a plain or flat country. The the word Pampas is derived from an Indian, which to the Quichue language possesses exactly the same meaning.

AGRICOLA, Visalia.—From the days of Cato the Censor to the present time, in European countries, those lands have ranked highest in value that were under viniculture, and second on the list stood ozier beds. No civilized State in the world possesses more facilities and inducements for the cultivation of both than California.

POCOTILLO.—Why do you write anonymously? If the newly enacted Nevada law legalizing conveyances by minors,—which you say was "specially passed to fit McCauley's case,"—can be shown to be *ex post facto*, the chances are that the "honest minor" may gain his case.

COMMUNICATIONS on a "New Method of Treating Sulpburet Ores," by M. R. Jeffards of Chicago, (a Moutana miner), and on the "Amalgamation of Silver ores without Roasting," by Charles H. Aaron, and some Pacific Railroad notes from W. H. M., will receive attention in our next issue.

CADWALADER'S MAP OF WHITE PINE RANGE AND DISTRICT.—Bancroft & Co. have just issued their long promised map of the White Pine Range and of White Pine District; the former showing the connection of the district with the railroad at Elko, in a strip of land seventy miles wide and extending about seventy-five miles south of White Pine, as far as Grant District; the latter showing about a third of White Pine District proper, on a scale of four inches to the mile. This scale has enabled the compiler to get in an immense number of details, embracing three or four hundred of the principal mines—out of the three thousand, which include an unknown proportion more properly designated as "wild-cat." The topography of this map is not so good, or easily comprehended, as that of some of the previously issued maps, but the quantity of information conveyed more than makes up for its pictorial deficiency. All mines, mills, roads, brickyards, reservoirs, surveys, etc., are represented. Gen. Cadwalader, the compiler, is the father of the Pacific Railroad engineer of the same name. The map seems to have been drawn on transfer paper, and lithographed from that.

Accompanying the map is a guide of thirty-one pages, in the getting up of which Dr. DeGroot's able assistance is made manifest. The price is $1.50.

The Copper Trade.

The great depreciation in the value of copper, for the last five years, has nearly ruined the copper mining interests of Lake Superior, and put a complete stop to that branch of business in California. The large amount of capital invested in the former locality, however, has been sufficient to warrant the initiation of active efforts to bring about such legislation as shall so enhance the value of copper as to make the working of those mines once more profitable. These efforts have finally culminated in success, and we have now a Copper Bill, which has become a law, over the President's veto, by which some of the more productive mines of Lake Superior can be worked to a profit, but which does not afford sufficient protection to enable the reopening of the less productive ones, or any of the mines in this State. The Eastern papers characterize the Bill as a swindle, from the fact that its provisions will enable only three or four of the best of the mines, as stated above, to resume operations, the produce of which will furnish but a mere moiety of the copper required by our commercial interests; while the great bulk of that metal must still be imported at rates which cannot fail to prove a serious detriment to the ship-building interest of the coast, which is already prostrated by over-taxation and other drawbacks, growing out of the late war. If the above statement is correct, which appears to be the case, the people at large are to be severely taxed for the benefit of a few greedy stock-speculators in Boston and at Lake Superior. California will derive no benefit whatever, from the bill, either in the way of plunder or legitimate gain, although her representatives were a unit in its favor—so voting, no doubt without a proper understanding of its effects.

It is perhaps to be regretted that legislative action in this direction should have been taken at this time, as there is good reason for believing that the natural course of trade itself would soon have set this matter right. The great increase in the production of copper, for the last few years, which has led to a corresponding reduction in price, has been mainly due to a large supply from rich superficial ores in Chili—which country has furnished more than half the world's supply for the eight years past. This supply being chiefly from superficial ores, is already beginning to fall off, and in all probability will still farther decrease. The production in England has also been constantly decreasing for the last ten years, while that of Russia has now nearly ceased, and most other sources of supply, outside of the United States, are either falling off or quite stationary, from an exhaustion or depreciation in the yield of the mines.

Many writers have attributed the late depression in the price of copper to a growing decrease in its commercial use, and point with much confidence to the lessened demand for copper sheathing for vessels, for casting bronze cannon, and for copper coinage. Although these statements are correct, other things, which should be taken into account, are forgotten. Though fewer ships are sheathed with copper than formerly, there is nevertheless, on the whole, an increased demand for copper in ship-building, which is used otherwise about ships, especially steamers, the construction of which requires much more copper for a given tonnage than sailing vessels. There are but few bronze cannon cast now; but the demand for that manufacture has for years been almost exclusively supplied by the remelting of old cannon, so that that business has drawn nothing, comparatively, from the world's annual production. An important and quite new demand for copper has sprung up within a short time, in the shape of cartridge cases for breech-loading guns. This demand now averages many thousand tons annually. Copper used for this purpose never finds its way back again. There is also a growing increase in the consumption of copper for railway purposes,—for locomotive boilers, tubes, etc. This demand, of itself, more than doubles the falling off in any other department of manufacture. Russia, alone, it is estimated, requires 2,000 tons of copper annually for this business—an important item when the total world's production only reaches about 90,000 tons. There are many other directions in which new and increased demands for copper are springing up.

Taking all these things into consideration, there is no bad prospect ahead for the copper business. During the last few years, since copper has been so rapidly depreciating, everybody connected with its manufacture or consumption has been aiding to keep the price down, by a hand-to-mouth way of doing business, fearing to keep any unnecessary amount of stock on hand lest it should depreciate in price. The stock of copper in the world is now very small, and must henceforth be gradually increased. Consumers and dealers are already gaining confidence, and speculators are taking an increased interest in this long-neglected article. The time is not far distant, when, without oppressive legislation, the copper business, even in California, will again become profitable. The large supplies of first-class ores, from this State, which reached Europe just previous to the late unfortunate crisis in the business, deservedly attracted the attention of operators there, and led to the remark, in one of their circulars, by the Messrs. Vivians, the largest copper smelters in Europe, that "California, next to Chili, seems deservedly to attract most attention," of any copper-producing country in the world.

The Nevada State Mineralogist's Report.

At length we have received a copy of this document, by the hands of the Rev. A. F. White, the State Mineralogist himself. So many of our Nevada exchanges have been finding fault with it that one would be led to believe Mr. White utterly incompetent. We do not find sufficient ground for all of these left-handed notices in the Report—which is an octavo pamphlet of ninety-six pages filled to the end with facts pertinent to mining developments, and every paragraph is original. Had Mr. White ventured unwarrantably into theories concerning the geological or mineral formations observed by him, he might have made his report more interesting, and laid himself open to more real occasion for attack. In adopting Richthofen's lithological terms, as descriptive of the volcanic rocks met with, he has embodied unmeaning words to the majority, but enabled others to comprehend with some degree of definiteness his observations of the distribution of eruptive matter in Nevada. If, instead of speaking simply of ores he had been careful to note a little more fully the exact minerals met with at different depths, and under varying circumstances, the report would have been more valuable both to millmen and miners. Mr. White is a self-made man, and of even less pretension than his merits warrant.

CALIFORNIA TYPE FOUNDRY.—We have received the second sheet of "faces" manufactured at this establishment, and which has just been issued in a very neat pamphlet form from the press of Wade & Co., 411 Clay street. Messrs. Faulkner & Son, Agents of this Company, say, in their preface, that they have cast over 80,000 pounds of body type since their establishment in January, 1867. Their type is now in use at nearly all the newspaper offices in this city. A sample of a new "California Italic" is given, which presents a beautiful appearance, and is particularly adapted to blanks, circulars, etc. We are pleased to acknowledge this new evidence of California progress.

Permanency of Interests in the Mountain Counties.

Following closely on the heels of the late Land Office decisions adopting the policy of granting fee simple titles to placer deposits, we find there is leavening and spreading in the semi-agricultural mining counties a strong movement showing itself with the flowers and green growths of spring, in favor of permanent and settled titles to such land as is occupied and considered most valuable at present for agricultural purposes. The signification of this movement is that there are now many people living in those regions who are content to remain there; that *homes* have been made which are beginning to be worthy of that permanent name in the foot-hills; that "pulling up stakes" is soon to cease being the rule and the curse of the most delightful and the most prolific region, in material resources, of the Pacific coast. Possessory titles have been the law;—good enough for temporary purposes, but not satisfying. Their operations in mining is perhaps all that would commonly be desired, but in regard to permanent developments above ground it has evidently been bad, and it is time that there should be some change. The destruction of all the timber of the foot-hills is perhaps the greatest injury that it has done, a man not being hindered from abandoning his location the moment that the timber is exhausted, and making a fresh one to suit the times.

If the status of land titles is the cause of our otherwise unaccountably neglected lands in the foot-hills, what legislation shall Congress be called upon to enact? In the first place it was, strictly speaking, perhaps straining a point to construe placer deposits as "veins." That point should be more definitely settled; there being no objection to the permanent sale of mineral lands urged by any of our exchanges, except the *Calaveras Chronicle*, that we have seen.

It is suggested that petitions should be circulated in the mining counties asking Congress to pass a law throwing all public lands in the mountains open for preëmption and sale, irrespective of the question of their agricultural or mineral characters—which is the bar in all present proceedings. It has been found, in the recent case before the Register and Receiver at Sacramento, calling for testimony in regard to the classification of some 30,000 acres of unclassified land southeast of Auburn, that every agriculturist is placed in the unfavorable position of sustaining an undecidable lawsuit before obtaining his title, when in point of fact there is no occasion for conflict with any body, were the law only left in an open enough shape to suit the facts.

Possessory titles to mines and lands are conceded to be equally good at present. But the numerous advantages that would accrue from permanent titles, seem to overbalance all objections that can be stated to any legislation in the premises, the object of which is to facilitate permanent settlement and developments of every other kind in the foothills.

SPECIMENS FROM THE GLENWOOD MINE, El Dorado Co., have been shown to us by Mr. S. P. Leeds, which, besides being unusually rich in partially very perfectly crystallized gold, show the accompanying quartz in that peculiar porous condition which indicates that there was another mineral of a soluble character deposited in the vein at the same time with its present contents, but which was afterwards carried farther by similar agencies to those which filled the vein. Pyrites, gypsum, calcspar, etc., behave in that manner, under the proper conditions. The Glenwood vein is 14 feet wide, has a fluccan on each side, dips to the west, and is part of a quartz formation of similar character extending 7 miles. The ore assays $13.60, on an average, throughout, and being 930 to 940 fine. We are indebted to Mr. W. Vale, the secretary and treasurer, for a copy of a report of this mine, which furnishes precisely such facts and figures as mining managers ought always to circulate freely amongst those who are interested, or to become interested, if the intention is to operate on an intelligible basis.

This Year's Mechanics' Institute Fair.

"Forty-nine and Sixty-nine," says Old Block, are California's most significant dates historically. In connection with the facts, (already noticed by us,) that the Mechanics' Institute of this city is in a position to make a success of another industrial exhibition—the greatest indeed that has yet taken place under the auspices of that institution, unless unforeseen obstacles should operate adversely—and that such an exhibition has been fully determined upon, additional circulars having just been issued giving due notice to local manufacturers, we take pleasure in being able to state that steps are also being taken to connect with it the prestige of the great railroad opening to which not only California, but the Atlantic States and the commercial circles of the entire world, are looking forward with interest. A meeting is to be held at the Mechanics' Institute building this (Saturday) evening, for the purpose of devising a plan and making suitable arrangements; at which some little "spouting" may take place perhaps, and a good working committee will be appointed.

The Mechanics' Instituto Fair of 1869 will be the San Francisco end of the great celebration; and that which is destined to come to pass will surely not prove discreditable to our State and coast. September 14th is the day fixed for the opening of the Exhibition. By that time the continental road will be in good and safe running order; and it is also the time fixed by the Odd Fellows of the United States for their grand Annual Conventiou, which is to take place for 1869 in this city. The East will come on a visit to the West, and there will be such a demonstration at once of national unity, and of fraternity, as could never have taken place without a War, and without the completion of a Continental Railroad.

Odd Fellowship signalizes its own high rank amongst the living forces of the times by thus recognizing and participating actively in the spirit of Sixty-nine.

A NEW MARINE PAINT.—A company has recently been formed in this city for the manufacture and sale of a new paint, known as the "California Metallic Marine Paint." This composition is a California inventiou, the patent for which was obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. The composition is one of a compound chemical character, quite different from anything else in use; and one which has already been subjected to a thorough practical test. When applied to vessels or piles, it is said to form an efficint preventive agaiust the ravages of the *teredo*, while its use upon either wood, iron or copper, upon vessel's bottoms, effectually prevents their "fouling," and greatly diminishes the wear and tear upon the same. It is also valuablo as a preservative for wooden structures of all kinds, for hridges, railroad timbers, etc. The names of the partics who represent the company as trustees and officers, afford a guarantee that the article which they offer the publlc is something of value. See advertisement in anothor column.

THE "GO-AHEAD GOLD AND SILVER MINING COMPANY," is the name of a company of onergetic miners just organized, with a capital stock of $50,000, for the purpose of prospecting and developing certain placer mines in Mountain Spring District, Sierra Couuty, on the road leading from La Porte to Gibsonville. There is a gravel ridge six or eight miles in length, between those places, which is believed, for sufficiontly good reasons, to be very rich, hut the paying deposits are deep in, and require a systematic undertaking of the work.

CONTINENTAL Life Insurance Company, 203 Montgomery street, corner of Pine.

PAIN KILLER!

The Great Family Medicine of the Age. Taken internally, it cures
Dysentery, Cholera, Diarrhœa,
Cramp, and Pain in the Stomach,
Bowel Complaints, Painters' Colic,
Liver Complaint; Dyspepsia and Indigestion,
Sore Throat, Sudden Colds,
Coughs, etc., etc.
Used externally, it cures
Boils, Felons, Cuts,
Bruises, Burns, Scalds,
Old Sores, Sprains, Toothache,
Pain in the Face, Neuralgia,
Rheumatism, Frosted Feet, etc., etc., etc.

The Pain Killer is sold by all Druggists and dealers in Family Medicines.

THURSDAY.

THURSDAY..... .....MAY 6, 1869,

At 12 o'clock, at Salesroom,

No. 827 MONTGOMERY STREET,

Special Credit Sale

— OF —

Montgomery Street Property,

By order of the Trustees of the Montgomery Street Real Estate Company.

We will sell on the above dato

1,000 FEET FRONTAGE

ON MONTGOMERY,

BETWEEM MARKET AND HOWARO STREETS,

Which will embrace **13** FINE CORNERS, as follows:

One on Montgomery and Market,
Three on Montgomery and Jessie,
Three on Montgomery and Mission,
One on Montgomery and Minna,
Four on Montgomery and Natoma, and
One on Montgomery and Howard Streets.

Montgomery street, between Market and Howard, is **70** feet in width, and will be sewered, paved with Stow pavement, curbed and sidewalked.

TERMS—One-fourth cash; one-fourth in one year; one-fourth in two years; one-fourth in three years—deferred payments to bear interest at the rate of ten per cent. per annum, payable monthly, and be secured by mortgage on the property.

Diagram Catalogues will be ready in a few days, and can be had on application at our office.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different special ties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are varied and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

ONE THOUSAND SHARES

— OF THE —

UNASSESSABLE STOCK

— OF THE —

Nantucket Mining Company

Are offered for sale at ONE DOLLAR PER SHARE, for the purpose of raising a fund to aid in the development of the mine. The mine is located on TREASURE HILL, about half a mile west of Treasure City, adjoining the "Salt Point on the east. No other issue of this stock will be offered at less than $2.50 per share, the object being to raise a small fund for the immediate prosecution of the work. The Trustees, in offering this stock, confidently believe it to be ONE OF THE BEST INVESTMENTS in the market. Subscription Books now open at the office of the Company, No. 619 Montgomery street. By order of the Board of Trustees.

W. H. BROWN, President.
15v13-1m H. B. CONGDON, Secretary.

ILLINOIS
SILVER MINING COMPANY

White Pine District.

Trustees:

JAS. H. CUTTER, B. H. FREEMAN,
E. H. SHAW, JAS. R. GARNISS,
DAVID BUSH.

The Company's Mine adjoins the celebrated "Silver Glance," and is in close proximity to the "Argyle," and other prominent mines of the District.

From developements already made, the Trustees feel justified in saying to their friends that this is one of the best opportunities ever offered for investment in this State.

For the purpose of further developing the mine, the Company has set aside a limited amount of stock, to be sold as a working capital, of which they now offer 1000 shares, at the nominal price of $2 50 per share, unassessable—the entire proceeds of which will be devoted to developing the mine.

The books of the Company are now open for subscription at the office of the Company, No. 432 Montgomery street, Boom No. 1, first floor. By order.

JAS. H. CUTTER, President.
G. W. STEWART, Secretary.
15v18-1m

CALIFORNIA

Marine Metallic Paint.

This Composition, the result of scientific and chemical research, after having been thoroughly tested for the past twelve months, is now offered for sale by the "California Marine Paint Co" incorporated March 25, 1869. The experiments to which it has been submitted, have proved that it is one of the most valuable discoveries of this wonderful age of invention It has been extensively used in painting the bottoms of all kinds of sailing vessels, wood, iron and copper, and with invariable success. Wooden bottoms, piles, etc., are thoroughly protected from the destruction of the *teredo navalis*, or sea worm; and iron vessels effectually preserved from the adhesion of barnacles, grass and all descriptions of zoophytes, no injury whatever resulting to the plates, as frequently occurs from the use of copper, and other pernicious paints; but, on the contrary, its known properties will preserve them.

By the use of this Paint, coppering vessels is rendered unnecessary; but where a vessel has been coppered it will not only keep it from fouling, but preserve the copper from the ordinary wear and tear, amounting to 10 per cent. per annum, and render it almost indestructible.

It is also invaluable for the preservation of all wooden structures, especially railroad timbers, bridges, floor beams in houses, telegraph posts, and is a certain preventive against the action of the white ant and comagen of Mexico, China, and India.

The company are now prepared to supply all orders, and enter into contracts for the application of this Paint.

Orders and communications in regard to terms, addressed to Capt. R. H. Waterman, President; James Pollock, Superintendent Dry Dock; or L. L. Bullock, Tide Land Commissioner, will receive prompt attention.

R. H. WATERMAN, President of Company.
LLOYD TEVIS, JAMES POLLOCK, L. L. BULLOCK, SCOTT TIOBALL, THOS. A. TALBERT, } Trustees.
JOHN S. ROLLS, Secretary.

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v1day-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

EFFECT OF GAS UPON FURNITURE, &c.—During the recent hearing of the gas question before the New York Board of Health, fully reported in the *Gaslight Journal*, Prof. Silliman, who was called to give his testimony, as an expert, read, in the course of it, the following from a recent article by Dr. Letheby:

"About 15 or 20 years ago, when I began to inquire into this matter, I was struck with a circumstance which is now, as it was then, very remarkable—namely, that wherever gas is burnt continuously, and in large quantity, it causes a rapid destruction of textile fabrics, with a very acid condition of them. This is notably so in our public libraries, and in warehouses and shops. I obtained so many striking proof of this, especially from the libraries of the Athenæum Club House, the London Institution, the College of Surgeons, and elsewhere, that I made them the subject of a special report to the authorities in 1854, and here you will see the specimens of covers of books which were furnished to me at that time. If you apply a piece of the leather to your tongue, you will taste its acidity, and if it be treated with water or spirit of wine and tested with a solution of baryta, it will be found that the acid is sulphuric acid. These effects were observed many years ago, in the library of the Athenæum Club House, and they were growing to be so serious, that the managers requested a commission of chemists, including Doctor Prout, Mr. Aiken and others to inquire into it, and I have before me a copy of their report on the subject. It is to the effect that the mischief is clearly due to the presence of sulphuric acid, which had come from the burning gas; and they state that the mischief will continue as long as gas is used in the library without proper ventilation. Mr. Faraday therenpon designed the system of ventilation which is still used in the library. As to the effects of the products of burning gas on shop-goods, they are notorious, for such goods are regularly disposed of as damaged or gassy things. It has been remarked, too, that plants are quickly killed by the products of burning gas, for they are peculiarly susceptible of injury from the presence of sulphurous acid in the air; according to Drs. Christison and Farmer, as little as one part in 10,000 of air will kill plants in less than 24 hours. And you cannot use gas in a conservatory, either for heating or for illuminating purposes, unless the products of combustion are entirely removed. Dr. Christison has written to me very strongly on this subject; and he attributed the absence of flowers and plants from the rooms of Edinburgh to the circumstance that gas is universally used in them. Advancing a step further in my inquiries, I ascertained that the water produced by burning gas, collect it how you will, is always acid, and will rot leather, paper, cotton, and linen. Here are specimens of such tissues, which have been dipped in the condensed liquid products of gas combustion, and you will observe that they are as rotten as tinder."

CANALS AND RAILWAYS.—The Erie Canal, originally built for vessels of sixty tons, has just been enlarged for those of 250 tons, and its increasing traffic already demands an enlargement for vessels of 1,000 tons. Of the traffic of the great West it now carries more than all of the great trunk lines of railway between the St. Lawrence and the Potomac. One canal boat carries more tonnage than a freight train, and the Erie Canal brings daily to tide-water more than five times as much tonnage as the New York Central. Its tonnage exceeds that of all the foreign commerce of this city.—*Hon. W. J. McAlpine.*

MINING TITLES.—The Nevada *Gazette*, in an article on obtaining title to mineral lands, says that miners should have a full and complete title to their mineral locations. It very properly suggests that there should be a land office exclusively for that mineral district, and that miners should not be compelled to go to Marysville or Sacramento, into purely agricultural districts, and put to great expense in proving up their titles and fighting their way through the tortuous intricacies of the law. All that the miners demand is that they be put upon an equal footing with ranch men. As the law now stands, the burden of proof is entirely against the miners, and it takes four times as long a time, and infinitely more trouble and expense for them to obtain a title.

A PORTLAND mechanic has made a fine cambric needle which can be unscrewed, and which contains, in a hollow within, another smaller needle.

GEOLOGICAL SURVEY OF OHIO.—The Cleveland *Herald* says: "A number of years since a partial geological survey of the State was made. A mistaken economy on the part of the State terminated the work when but a small part had been completed, but that which had been done has proved an incalculable benefit in revealing a portion of the mineral wealth of the State, and enabling mining operations to be carried on intelligently. Every year has shown the folly of the legislature in stopping the appropriations before the survey was completed; and the feeling in favor of the resumption of the work has been yearly growing stronger. The increasing demand for coal, the tendency to seek out new sources of supply, and the reports from time to time of mineral discoveries in various parts of the State, combine to render desirable a complete survey that shall map out the geological structure of the State and enable projectors of mining enterprise to work intelligently and not sink pits at hap-hazard, or with no better guide than a 'divining rod,' or the revelations of a spiritualistic medium. Mr. Lee, of Delaware county, will introduce into the House of Representatives a bill to provide for a thorough geological survey of the State."

This is encouraging. As one of the "signs of the times," we welcome it. There is hope that other states may begin to suspect that there is a money value in a scientific survey of their resources. The feeblest glimmering of such a notion will do more towards bringing about such a survey, than a thousand eloquent appeals to the love of science as science.

IMPORTANT TO RAILROAD TRAVELERS.—The following "rules of the road" are based upon legal decisions: The courts have decided that applicants for tickets on railroad cars can be ejected if they do not offer the exact amount of their fares. Conductors are not bound to make change. All railroad tickets are good until used, conditions "good for this day only," or otherwise limiting time of genuineness, are of no account. Standing on the platform and otherwise violating the rules of the company renders a person liable to be put off the train. No one has a right to monopolize more seats than he pays for; any article left in the seat while the owner is temporarily absent, entitles him to his seat on his return.

PRESIDENT DWIGHT, of Yale College, is stated to have been the first American to cultivate the strawberry.

HINKLE'S
"IMPROVED SPRING-BED BOTTOM."
(Patented July 21st, 1868.
The undersigned, having purchased the Patentee's interest in the States and Territories of the Pacific Coast, is now prepared to supply Private Houses, Hotels and Steamers with this comfortable, economical and durable "IMPROVED SPRING BED BOTTOM."
Persons going to White Pine will greatly promote their comfort by taking one of these Patent Bottoms, which is secured to a folding Bedstead, the cost of which is less than that of the materials at White Pine.
Wareroom, No. 1002 Market Street,
P. HUDSON, Proprietor.
☞Call and examine. Open until 8 o'clock P. M.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to the public to warrant publication.

Engineering.

PACIFIC RAILROAD ENGINEERS IN TOWN. Qnite a number of the engineering attachés of the Pacific Railroad Company have been in town recently; Col. Gray, the Consulting Engineer, who is in charge at present of the terminus problcm, and the route to be followed to wharfage ground; Major Bender, late of the State Snrveyor General's office, in charge of work on the Western Pacific line, about Livermore's Pass, etc.; and Messrs. Guppy, Henry Wright and John Wood, have also been noticed on the streets, their employment requiring them to be partly here, and partly across the Bay. After all that has been said ahout the terminus, and the termini, it seems that the question is only now in prospect of being bronght speedily to an issne. Owing to the lagging in Congress of the Goat Island terminns proposition, the Pacific Railroad Company will in all probability be compelled to bridge the Bay, and this can best be done at Ravenswood, situated at its narrowest point between here and San José, and nearly opposite to the road's emergence from the interior through Livermore's Pass. Thence it will continue to San Francisco in the main along the San José ronte, and make a direct line across the tide lands for the lots in this city selected, and to be granted hy the Tide Commissioner for terminal purposes. The distance across the Bay at Ravenswood is not greater than from Oakland to Goat Island.

Instead, however, of entering the corporation limits by the present San José route, it is understood amongst residents of the Potrero who have had opportunities of becoming informed, that the water's edge will be followed along the San Bruno shore road, the greater indentations heing all crossed hy piling from point to point, like that in the Long Bridge and the South San Francisco bridge. These bridges and the cut through the Potrero hill are to he widened—so say the Potreroans—for the accommodation of the Pacific Railroad. The terminus will prohably he somewhere outside the Long Bridge beyond the Steam Navigation Co's wharf.

DEFINATION OF ENCINEERING.—Hon. W. J. McAlpine, in the last lecture of the winter course at Steinway Hall, New York, February 10th, said: "Engineering is peculiarly the exponent of modern development. Its defination is 'the acquisition of that species of knowledge whereby the great sources of power in nature are converted, adapted, and applied for the use and convenience of man,' which covers the civil and military engineer, the architect and mechanician, the closet theorist, and the practical workman. The snbject covers the locomotive and its railway; the steam engine and its application; the metals and their manipulation; the workshops and their great tools; modern ordnance and armor; naval construction, telegraphy, bridges, canals, water supplies, harbors, etc., has been characterized by the various applications of steam; the product and manipulation of metals and telegraphy."

THE CANAL SCHEMES of the Kern Lake country, and of the "Sacramento Irrigation and Navigation Co.," are meeting with much opposition, on the ground that the object is land-grabhing, rather than reclamation and irrigation. If the projectors are operating on a bona fide basis, they will only have to present the data in a full and intelligihle manner, in order to gain every assistance that projects of the kind cau deserve.

RAILROAD GRADES.—It has been found by calculation and experiment, that heavy trains may descend a grade of 1-100th without attaining a greater speed than ahout forty or fifty miles an hour, even if allowed to run freely without applying the brake to check the speed. The velocity due to the accelerating force of gravity soon attains its greatest limit, and remains constant during the remainder of the descent, owing to the resistance of the air.

A MINING STOCK BOARD has been organized at White Pine.

Pacific Protective Association of California.

INCORPORATED OCTOBER, 1868.

PROSPECTUS.

OBJECT.—The object of this Association is to secure a cash payment, within sixty days after the death of a subscriber, to his or her heirs or assigns of as many dollars as there are individuals of the class to which said deceased subscriber belonged.

MEMBERSHIP.—The subscription fees are Ten Dollars at joining, and One Dollar on the death of each subscriber. The One Dollar from each subscriber is paid to the heirs or assigns of the deceased.

THE FUNDS.—The By-Laws of the Association require that a portion of the money received as subscription fees shall be a Sinking Fund to meet assessments falling due by the delinquencies of subscribers. The balance of the money received to be used for the payment of the expenses incurred by the Association.

MEMBERS.—A subscriber failing to pay his or her assessment of one dollar within Thirty days from receipt of notice forfeits his or her Certificate, and all claims upon the Association, unless good cause is shown for further delay. A subscriber can forward money in advance, which amount will be credited on future assessments. The subscribers are divided into classes including males and females. Each class is limited to 5,000 subscribers. As classes are filled, new ones will be formed. No person is so poor that he cannot pay Ten Dollars at joining and One Dollar occasionally, thus securing $5,000 to his or her heirs or assigns.

ADVANTAGES.—The advantages of this Association are, that no *money panic* can affect it. Its benefits are easily obtainable by all, and every subscriber added to the Association enhances the interest and protection of all; the amount paid being so small, and only at long intervals, that any person can secure for his family a competency upon his death.

CLASSES.—In Class A, all persons between the ages of 15 and 40 years; in Class B, all persons between the agos of 40 and 60 years.

Any one that has not stated his or her age correctly, will forfeit all money paid and his or her Certificate.

One class cannot be assessed if one of another class dies. Classes have no connection with each other.

HOW TO BECOME A MEMBER.—A person desirous of becoming a subscriber must fill out an application, and forward with it Ten Dollars by Check, Draft, or by Express, in gold or silver coin. Persons can pay agents, when regularly appointed and authorized to receive money. Each subscriber should interest himself in obtaining new members, by so doing all are benefited.

BOARD OF DIRECTORS.—Benjamin H. Freeman, George H. Russell, Samuel A. Raymond, James A. Pritchard, W. Le Roy.

OFFICERS.—Benjamin H. Freeman, President; George H. Russell, Vice President; John H. Warren, Secretary; James A. Pritchard, Treasurer.

REFERENCES.—Hon. Henry Dutton, President of Farmers' and Mechanics' Bank; Hon. Samuel Cowles, late Judge County Court, San Francisco; Hon. A. J. Cunnison, Attorney at Law, San Francisco; H. J. Booth, Esq., Union Iron Works, San Francisco; Henry F. Williams, Esq., Real Estate, San Francisco; John O. Hanscom, Esq., Etna Iron Works, San Francisco; John H. O'Brien, Esq., of O'Brien, Bush & Co., San Francisco; Hon. J. P. Jones, Gold Hill, Nevada.

All communications should be addressed to the Secretary of the

PACIFIC PROTECTIVE ASSOCIATION,

S. E. COR. OF MONTGOMERY AND SACRAMENTO STREETS, (Over Donohoe & Kelly's Bank,) SAN FRANCISCO.

[10v18 3mos.]

CARRIAGE SPRINGS.—Our mechanics are generally wide awake. Whenever any new branch of mannfactures is likely to pay, they quickly see it. Belduke & Co., wagon makers, 820 Folsom street, have recently embarked in one of these enterprises which appears fnll of promise. With an additional outlay of about $8,000 for engine and boiler, fnrnaces and other necessary machinery, they represent themselves as now fully prepared to manufacture wagon and carriage springs of all sizes and descriptions, in the very best style of the art, as conducted in the Atlantic States.

They have provided themselves with all the latest improved tools and machinery for condncting the business on a large and economical scale. The waste heat from the furnaces is treasured up and used again in heating the boiler, an item of economy in itself, hy no means inconsiderable. They have their steel imported expressly for the purpose, to secure the hest material.

The process is abont as follows: The bars of steel being cut the proper length by the shears, the sections are taken to the furnace and heated. They are then passed under the large and powerful rollers, worked by machinery, and drawn to the required thinness at the extremities. Thus prepared, they are returned to a furnace to be subjected to a nniform heat; after which they are fitted, tempered and polished. The last step in the process is to submit the springs to a test in a machine built expressly for the purpose, when they are ready for the market.

The punch and shear press, together with the rollers, were designed hy Mr. T. Stebins, pattern-maker at the City Iron Works, and most of the machinery and tools were put up by the Union Fonndry, the whole being of California mannfacture.

This firm, from their past experience in this line, and with all the appliances at command, are fnlly confident that they can compete in all respects, with the Eastern market. They certainly deserve credit, as well as encouragement, for the pluck and energy displayed.

OUR Gilroy contemporary complains of a correspondent of the PRESS who inserted amongst some Gilroy statistical items, which he procured, a stick-fnll additional figures which were clipped from the local paper, and not dnly credited. We do not think that our correspondent was ambitious either of undeserved fame, or of a reputation for industry not exercised hy him, but, that he was simply careless. The author of every article or item should in general be held responsihle for what he writes, especially when the noting of the authority wonld convey additional information to the reader concerning the matter, which is worth possessing. To omit giving credit intentionally in such a case, though a common practice, is leaving out an important part of the item, therefore worse than carelessness—it is stupidity.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 17th and 30th of each month that has 30 days.

On the 10th, 18th and 30th of each month that has 31 days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 17th falls on Sunday, they will leave on the Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 17th or 18th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

April 10th—CONSTITUTION.....Capt. Wm. H. Hudson, Connecting with ALASKA, Capt. Gray.

April 17th—GOLDEN CITY.....Capt. Wm. F. Lapidge, Connecting with HENRY CHAUNCEY, Capt. Connor.

April 30th—MONTANA.....Capt E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Passengers berthed through. Baggage checked through. One hundred pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets to Liverpool by the "Inman" and "National" Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight to New York and Way Ports, Company's Form of Bill Lading only used.

No Freight will be received on board after 2 P. M. of the day prior to the steamer's departure.

The Steamship GREAT REPUBLIC, Capt. J. M. Cavnrly, will be dispatched for HONGKONG on MONDAY, April 5th, 1869, at noon, connecting at YOKOHAMA with the steamer NEW YORK, for SHANGHAI.

For passage, freight and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Valuable and Popular Practical Books.

Painter, Gilder, and Varnisher's Companion. Containing Rules and Regulations in everything relating to the Arts of Painting, Varnishing, and Class Staining, with numerous Useful and Valuable Receipts; Tests for the Detection of Adulterations in Oils and Colors, and a Statement of the Diseases and Accidents to which Painters, Gilders, and Varnishers are particularly liable, with the simplest methods of Prevention and Remedy, with directions for Graining, Marbling, Sign Writing, and Gilding on Glass. To which are added Complete Instructions for Painting and Varnishing. 12mo., cloth..... $1 50

The Practical Brass and Iron Founder's Guide.—A Concise Treatise on Brass Founding, Molding, the Metals and their Alloys, etc.; to which are added recent Improvements in the Manufacture of Iron, Steel by the Bessemer process, etc By James Larkin, late conductor of the Brass Foundry Department in Reany, Neafie & Co's Penn Works, Philadelphia. Fifth edition, revised, with extensive additions. In one volume, 12mo..... 2 25

A New and Complete Treatise on the Arts of Tanning, Currying, and Leather Dressing.—Comprising all the Discoveries and Improvements made in France, Great Britain, and the United States. Edited from Notes and Documents of Messrs. Salleron, Groavelle, Duval, Dessables, Labarraque, Payen, Reuie, De Fontenelle, Malapeyre, etc. By Prof. H. Bussauce, Chemist. Illustrated by 212 wood engravings, 8vo..... 10 00

The Miller's, Millwright's and Engineer's Guide.—By Henry Pallett. Illustrated. In 1 vol. 12mo..... 3 00

American Miller and Millwright's Assistant. By Wm. Carter Hughes. A new edition. In one volume, 12mo..... 1 50

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address.

HENRY CAREY BAIRD,
Industrial Publisher,
406 Walnut Street,
20v16tf Philadelphia.

To Quartz Miners.

Having a new system of Amalgamation, styled the

PAUL & WOOD ELECTRIC PROCESS,

And which has been so fully tested as to be worthy of your consideration, I now invite it, relying only on the precious metals produced, cheapness and simplicity of machinery, to gain favor for it.

Parties having mines containing a high percentage of gold and silver, but which cannot be obtained, on account of fineness, or rebellious character of the ore, will do well to investigate. Attention given to communications.

Address, ALMARIN B. PAUL,
11v18 1m 408 California st., or Miners' Foundry. San Francisco.

Wholesale and Retail!

SUPERIOR GOODS! REDUCED RATES!

C. C. HASTINGS & CO.,

SUCCESSORS TO

Heuston, Hastings & Co.,

SAN FRANCISCO AND NEW YORK,

Announce to the friends of the old firm, and the public at large, that their present business arrangements are such that they are enabled to offer the best and most stylish goods on the Pacific Coast at a great reduction from former prices.

AT WHOLESALE.

The attention of the merchants throughout the Pacific Coast, is called to the fact that we are now prepared to fill their orders for superior goods in

Strictly Custom-Made Clothing,
Suits, Gloves, Hosiery, and
Furnishing Goods, Trunks,
Traveling Bags and Valises,

In lots to suit at regular wholesale rates.

CLOTHING TO ORDER,

Made either in New York or San Francisco, under the supervision of the best cutters in America.

DIRECTIONS FOR MEASUREMENT

Sent to any address upon application, and goods forwarded by Express on receipt of orders. Satisfaction guaranteed.

CRUDE BULLION.

Crude Bullion of any kind, bought at the highest prices. Address, ALBERT ARENTS, 110 Kearny street San Francisco. 13v18-3m

Resources and Developments.

WOOLEN MILLS IN CALIFORNIA.—We are informed by one interested in the business, that the woolen mills at Sacramento and Marysville are both engaged night and day at present in the manufacture of White Pine blankets, and are still unable to supply the demand. The San José Woolen Mill is likely to be brought into existence at an early day. The Oroville and Los Angeles projects are not yet brought to a head. Chinese labor is universally employed, and found to be equal, if not superior, to white labor; while it costs 10 per cent. less actually than white labor in the Eastern States. Under existing advantages it is believed that we may, before many years, export woolen goods to the East with a profit.

SILK IN LOS ANGELES.—The Los Angeles *Star* says it is intended to form a Silk Growers' Association in that county, for the purpose of propagating the silk worm and conducting the business connected with silk culture, as far at least as reeling the silk from the cocoons.

Messrs. Cover & Franklin have set out, in the neighborhood of the city, about half a mile west of the race track, a lot of land about eighteen acres in extent, in mulberry trees and cuttings, there being 10,000 seedlings of the morus alba, and 150,000 four-inch cuttings of the morus multiculis.

In connection with the foregoing, we may mention the fact, that Dr. Franklin has succeeded in obtaining, direct from Japan, through the Italian Consul at San Francisco, one cartoon of eggs of the worm which produces green silk, being one ounce or 40,000 eggs.

WORMWOOD appears to be a new article of traffic in this State. Sixteen bales of 250 pounds each were recently forwarded, at one shipment, from San Joaquin to this city, where it is manufactured into bitters.

A SCIENTIFIC TRACT SOCIETY has been proposed in New York as a means for the diffusion of useful knowledge among the people.

COAST LUMBERING.—Magnificent forests on the northern coast adjacent to shipping, are to a considerable extent still regarded as valueless, on account of the difficult bars at the outlets of the rivers, rendering them inaccessible. Steam-tugs are gradually opening new lumbering fields of this kind.

A NEW steam-tug was launched at Port Orchard, Washington Territory, a few days since. It is 65 feet long, 13½ feet beam, 6 feet depth of hold, and was built by and belongs to the Port Orchard Mill Co.

New Inventions.

THE NEW STYLE OF PILE DRIVING.—A model of the new pile-driving machine, in which powder is made to play a prominent part, has recently been brought to this coast, and is on exhibition by Mr. F. A. Hill, corner of Sansome and California streets. The peculiarity of this invention consists in the use of an iron chamber, which fits upon the head of the pile, and is hollow in the upper part. Into this chamber is placed a small charge of fulminating powder. The hammer, released from the ratchets by which it is held, falling upon the chamber, compresses the air (the chamber only being partially filled with powder) and starts the pile. An explosion follows, and the hammer is thrown upwards until caught by the ratchets. A portion of the force of the explosion is also expended upon the pile. The invention has been tried with success, we believe, in many of the Eastern cities.

NEW COUNTING MACHINE.—Mr. Vannader, of Potter Valley, in this State, has invented a counting machine, "which can be used in billiards, crib, ten-pins, and is peculiarly adapted to tallying for a threshing machine." It will also subtract. Mr. Vannader will apply for a patent.

AERIAL LOCOMOTION.—Master Siegrist has filed a caveat, claiming the invention of flying a velocipede. The machine is designed to run on a wire or rope, at any distance from the ground. Master Siegrist has become quite expert in managing the odd contrivance.

SAFETY RAILROAD.—Mr. Prettyman, of Multnomah County, Oregon, has made an improvement in railroad cars, which consists of wheels or pulleys to prevent the cars from running off the track.

White Pine Summary.

WORK DOING.—If Treasure Hill is a "monntain of solid silver," the tunneling companies are certainly on the direct road to luck. In any event the prospects offered seem to warrant undertakings of the kind, the rock being soft, and the probability of striking valuable veins in connection with Chloride Flat very strong. The Union and the American Basin are both already some distance in. News of actual development will be eagerly sought for, but kept quiet for speculative reasons. Probably nothing that is struck in the shape of veins will escape lawsuits as to title. In prespecting it seems every stone has not yet been overturned. From fifty to a hundred locations are made and recorded daily. The Mining Recorder invariably recommends all new comers not to buy old claims, but to go out and make new locations.

PROSPECTING AND NEW DISTRICTS.—Men are leaving Treasure City daily for Grant and Patterson districts, and other points to the southeast, where rich discovcries are reported.

TUNNELING FOR WATER.—These enterprises at Shermantown are progressing. Luther and Hney had not struck water in their tunnel at last accounts. Clark & Co. had struck a moderate stream of water, which increases every foot as they proceed. The tunnel was on March 9th, some seventy-five feet or more in length, and indications of a good ledge of silver ore were apparent. In consequence of the water, they are compelled to use the giant powder, which is quite as cheap, and answers for blasting purposes as well wet as dry.

STRIKES, SPECIMENS, ETC.—The White Pine *News* of March 27th, says: We were shown on Friday some very rich specimens of ore from the Schoharie ledge, at a depth of fifteen feet. The Schoharie was located in January, and includes 1,000 feet. It is situated about 1,500 feet from the Mazeppa, between that and the Eberhardt. The vein is four feet in depth, and has been explored to a depth of fifteeu feet. * * Mr. J. P. W. Davis, late of Healdsburg, California, a printer, has discovered a ledge on the eastern slope of Treasure Hill, which is described as a true fissure vein, six feet in width, and bearing rock similar to the Pocotillo. The vein is traceable for over 200 feet. Assays have showu a value of $175 per ton. * * Same of 31st: It was currently rumored yesterday that another very rich strike and extensive body of ore had been developed iu the Eberhardt mine, at a depth of 180 feet.

NEW WORKS—NEW DEVELOPMENTS.—The San Francisco Smelting Co. will shortly commence the erection of extensive smelting works at the flourishing little town of Swansea, a short distance above Shermantown. * * Some very rich developments have been made during the past few days in the vicinity of the California mine, on the southern end of Treasure Hill. The Knickerbocker, a claim situated in the vicinity of the Eberhardt, has turned out some very good ore, resembling both in appearance and the assayer's figures the ore from the Eberhardt. Work has recently been resumed upon the Knickerbocker. In the California, considerable quantities of ruby silver are reported to have been met with, and other claims in the vicinity are looking well. * * The Anita mine is situated about one mile from Hamilton, on the Shermautown road, and owned principally by parties iu Napa Valley, Cal. About two tons of fine ore is now lying at the dump, and work is progressing favorably. It is estimated that the ore will mill between $200 and $300. The Dividend miue, in the same locality, also turns out some fine ore, and day before yesterday some Germans prospecting in the vicinity struck rock which assays $900 to the ton. * * The Great Union Tunneling Co., composed San Francisco capitalists, proposes to run a tunnel under Treasure Hill, commencing at the north end, a short distance south of the Hidden Treasure mine. * * The old Manhattan mill, from Dayton, has been brought to Hamilton by the Union M. & M. Company.

OUTSIDE DISTRICTS.—PATTERSON.—*Inland Empire* says there are 250 men in the district, and the road thither is lined with prospectors. Mr. Barucy thiuks the Patterson mines are not over 80 miles from Hamilton, himself and a companion having ridden the distance iu two days quite easily.

SHOSHONE.—A letter from E. J. Hotchkiss speaks in the highest terms of Sheshone district, which is 25 miles northeast of Patterson. The writer says it is the best camp he has visited in the silver regions of Nevada.

GRANT DISTRICT lies about 65 miles south of Treasure City, in a continuation of the same range, the road being through Huntingten valley, and at all times passable for heavy teams. The ledges are very large, well defined, and cased in limestone and slate. Some are particularly massive, one, the Patriarch, being at least 200 feet in width and cropping for nearly three miles. Assays from the different ledges in the district, range from two hundred to as many thousand. A stage runs regularly to Shermantown. The town site of Grant has been surveyed, streets laid out and a number of houses built.

PIUTE DISTRICT is in process of organization, about 40 miles west of Hamilten, a sliort distance from the road leading from this place to Austin, and persons going by stage disembark at Piute creek. The C. L. Place, the New York, the Last Chance, San Francisco, and Our Own No. 1, are said to be large and well defined ledges, the lowest assay yet made from croppings being $123, the highest going $624. There are parties leaving daily for Piute creek, both from Hamilton and Austin. [The *Reveille* says this is Pinto, not Piute.—EDS. PRESS.]

WHITE CLOUD district is 75 miles north of White Pine. The Santa Clara *News* of March 27th, speaks of it as follows: Some months since a number of gentlemen at San José dispatched a party to prospect the place. He returned six or eight weeks ago. Mr. Charles Silent, of San José, was sent to examine the district, and returned with rock which assayed $70 gold, $9 silver, and from 23 to 43 per cent. copper.

INDIAN VALLEY, 80 miles east of White Pine, was discovered several months since, but kept secret until the last fortnight. The ore is said to resemble the best of that at White Pine.

The mining laws of Eureka have been so amended that a "deposit claim" shall be 100 feet sqnare, and ten dollars' worth of work shall hold a square six months.

New Mining Advertisements.

Daniel Webster Mining Company.—Location of Works: White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of April, 1869, an assessment of ten cents (10c) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the t nth day of May, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of May, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

C. A UHRIG, Secretary.

Office, No 418 California street, San Francisco.

Golden Rule Mining Company, Tuolumne County, California.—Regular Bi-monthly dividend (No. 19) of the Golden Rule Mining Company, of Tuolumne County, Cal., of 2½ per cent. per month, or fifty cents per share, is now declared, and will be paid to the Stockholders on and after the 26th inst. Office, 432 Montgomery street, Room No. 5.

J. B. RUSSELL, Secretary.

W. T. BOSWORTH, President.
A. S. PHIFER, Superintendent of Mine. ap10

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the sixth (6th) day of March, 1869, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John Amos	58	1	$1 00
A Birrell	17	10	10 00
A C Teltman	16	82 11-13	82 84
A C Teltman, Trustee	5	11 6-13	11 46
A C Teltman	29	64 8-13	64 61

And in accordance with law, and an order of the Board of Trustees, made on the sixth (6th) day of March, 1869, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., auctioneers, No. 426 Montgomery street, on Monday, the twenty sixth day of April, 1869, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. ap10

Mining Notices--Continued.

Cordillera Gold and Silver Mining Company.— Morelos District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1869, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth (20th) day of April, 1869, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the tenth day of May, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY B. REED, Secretary.

Office, 321 Washington street, San Francisco. mar20

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of January, 1869, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Baum, Charles	2	20	$15 00
Baum, Charles	63	50	37 50

Office, 37 New Merchants' Exchange, California street, San Francisco. mar24

Machinery.

VARNEY'S
PATENT AMALGAMATOR,

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into he pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

ELLERY'S PATENT
India Rubber Cement and Paint
—FOR—
TIN, IRON AND METALLIC ROOFS,

Iron, Brick and Wooden Buildings,

SHIPS, STEAMBOATS, STAGES, CARS,

AND FOR ALL EXPOSED SURFACES.

Is water-proof and indestructible; will neither rot, peel, nor crack; will withstand any climate; can be put on in any color, and is less expensive than other Paint.

New Cloth Roofs put on, Old Roofs cemented and painted. Leaky Roofs made tight.

☞ No Coal Tar or Asphaltum used. All work guaranteed. Orders punctually attended to.

PATENT
Boiler Scraper and Tube-Cleaner.

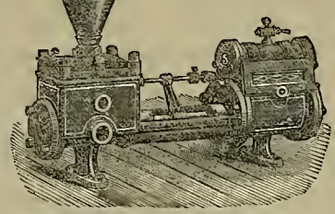
IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches rangine from $8 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

BLAKE'S PATENT



STEAM PUMP!

This Pump is warranted superior to any in the market, for Breweries, Sugar Houses, Tanneries, Boiler-Feeders, Steamboats, Mining and Fire purposes, etc. It throws a full stream of the thickest beer mash without clogging, and sugar syrup boiling hot without difficulty.

Warranted a positive Pump under ALL circumstances; it never stops nor creates disorder, and by reason of the patent device in the valves, is kept clear and always ready for action. It is SIMPLE, COMPACT and POWERFUL, and needs no expert to run it.

☞ If one fails to do the work for which it is sold, it may be returned and the money will be refunded. May be seen in operation at Risdon's, or Union Iron Works, or at

The Perfection of Prepared Cocoa.

MARAVILLA COCOA.

Sole Proprietors—TAYLOR BROTHERS, London.

The Cocoa (or Cacao) of Maravilla is the true Theobroma of Linnæus. Cocoa is indigenous to South America, of which Maravilla is a favored portion. TAYLOR BROTHERS having secured the exclusive supply of this unrivalled Cocoa, have, by the skillful application of their soluable principle and elaborate machinery, produced what is so undeniably the perfection of Prepared Cocoa, that it has not only secured the preference of homœopaths and cocoadrinkers generally, but many who had hitherto not found any preparation to suit them, have, after one trial, adopted the Maravilla Cocoa as their constant beverage for breakfast, luncheon, etc.

"A SUCCESS UNPRECEDENTED."

[See following extract from the Globe of May 14, 1868.]

"Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of "Maravilla" Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homœopaths and invalids we could not recommend a more agreeable or valuable beverage.

Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homœopathic Cocoa and Soluble Chocolate, Steam Mills, Brick Lane, London.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

[Written for the Mining and Scientific Press.]

Developments of the Teaff Hydraulic Mining Shaft.

DUTCH FLAT, March 30th, 1869.

EDITORS PRESS:—Aecording to promise, I herewith furnish you further data of the Teaff shaft at this place, and of the peculiarities of the curious deposit gone through in sinking the same. In the first place it should he understood that the top of this ground has been worked off to a considerable depth in hydraulic mining, and at the place where the shaft is sunk there is a hard stratum of iron cement, about six or eight inches thick, the result of a cementing combination of pyrites or sulphurets of iron, with gravel. Now yon find immediately under this a rich streak of dirt some thirty feet deep, of a greyish color; and under this another streak of the sulphuret deposit, but of a greenish east. This deposit is about two feet thiek; and when we begin to arrive at a depth of about 30 feet from this to the bedrock, throughout the whole distance, gold in coarse particles is visble in the sides of the shaft. The peculiarities are that there is a perfect line between each of the great periodical deposits which have been thrown into this large basin; and then it seems as though long periods had been employed in washing away all the lighter matter than the sulphurets, to certain depths; and then another deposit, and so on, in this manner, until this channel was broken by the eross streams which now flow from the Sierras.

Judging from the pieces of cement that I have seen from this shaft, and the distanee from the bedroek from which they were taken, I should be constrained to say that this is the richest part of the "Blue Lead" yet developed.

The shaft is now filled with water, up to the level of Mr. Teaff's tunnel, from the end of which the shaft is sunk, the top ground having been worked through this tunnel some 3,000 feet. The entire depth does not contain a pan of dirt without gold; I mean that from the top or grass roots, to the bedreek, 425 feet, contains gold in every pan. This top ground has paid well; but there must now he a tunnel run this hundred feet lower in order to drain the rich deposit of cement; and there must he stamps and machinery employed to work it. Mr. Teaff has the neeessary energy, and this large amount of ground, comprising what has been known as the "Welamaloo," "Franklin," "St. Midas Water Co.," "Little Hope," and "Fish Line," will begin to yield up their millions of golden treasure.

A. E. R.

GOLD MINING STILL PROFITABLE IN GEORGIA.—The following item we find in the *Air Line Eagle*, of Gainesville, Ga. Captain Bosworth is a Californian, and an old subscriber of the MINING AND SCIENTIFIC PRESS:

On Tuesday last, (Feb. 23d) we were shown by Captain N. S. Bosworth, of the Nachoochee mines, three nuggets of virgin gold, recently found in the mines he is working there, weighing respeetively 375, 249 and 103 dwts. The Captain is operating for a Boston Company—is working thirty hands, and is averaging about 100 dwts. per day. He also showed us at the same time the yield of his mines for the niueteen days previous, which was a handsome "pile"—weighing between six and seven pounds. Captain Bosworth informed us that as spring opens, he eontemplates increasing his working foree to seventy-five hands, and intends opening several valuable veins upon the property he is now working. The Captain is a praetieal miner, and this sueeess is but an index to what may be doue in the rich mines of this seetion, whenever skill and eapital are brought to bear upon them.

LARGE GUNS.—The largest European gun is of steel, by Krupp, 14 inches bore, and will throw a ball of 1,000 pounds, but has never heen fired. The next largest European gun is an Armstrong rifle, which throws a shell of 610 pounds. The 12-inch American Rodman rifle throws an elougated shot of 630 pounds, and the 20-inch smooth-bore, a spherieal shot of 1,072 pounds. The "Swamp Angel" is a Parrott rifle, 8 inches bore, and threw shot of 150 pounds a distance of 5½ miles into Charleston. Its ancient rival, "Mons. Meg," is 20 inches bore, and threw stone balls of 18½ inches diameter, but its range did not exceed a mile and a half.

BRILLIANT WHITEWASH, CLOSELY RESEMBLING PAINT.—Many have heard of the brilliant stucco whitewash on the east end of the President's house at Washington. The following is a receipt for it—for which we are indebted to Mr. Foye, of Oakland:

Take one-half bushel of nice unslaked lime, slake it with boiling water, cover it during the process to keep in the steam. Strain the liquid through a fine sieve or strainer, and add to it a peck of salt, previously well dissolved in warm water, three pounds of ground rice, boiled to a thin paste, and stirred in boiling hot, one-half pound of powdered Spanish whiting, and one pound of clean glue, which has been previously dissolved by soaking it well, and then hang it over a slow fire in a small kettle within a large one filled with water. Add five gallons of hot water to the mixture, stir it well and let it stand for a few days, covered from the dirt. *It should be put on right hot*; for this purpose it can be kept in a kettle on a portable furnace. It is said that about a pint of this mixture will cover a square yard upon the outside of a house, if properly applied. Brushes more or less may be used according to the neatness of the job required. It answers as well as oil paint for wood, brick or stone, and is cheaper. It retains its brilliancy for many years. There is nothing of the kind that will compare with it, either for inside or outside walls. (Buildings or fences prepared in this manner will take a much longer time to burn, than if they were painted with oil paint. This one thing alone should be inducement for persons to try the experiment.) Coloring-matter may be put in, and made of any shade you like. Spanish-brown stirred in will make red pink, more or less deep, according to the quantity. A delicate tinge of this is very pretty for inside walls. Finely pulverized common clay, well mixed with Spanish-brown, makes a reddish stone-color. Yellow-ochre stirred in makes yellow wash; but chromo goes further, and makes a color generally esteemed prettier. It is difficult to make rules, because tastes are different; it would be best to try experiments on a shingle and let it dry. Green must not be mixed with lime; it destroys the color, and the color has an effect on the whitewash which makes it crack and peel.

CURIOUS ISLAND.—In the lake of Ilsing, in Lavonia, there is an island that rises above water and disappears periodically. During the summer heat a considerable quantity of gas is generated from a bed of coal under the surface, then a huge, black mass, like a gigantic bladder, is seen to rise. If the summer is warm and lasting, the surface becomes one mass of aquatic plants, but on the first appearance of cold nights the whole island sinks and lies dormant until the ensuing year at the bottom of the lake. The various phases assumed by this strange phenomenon of nature serve as a weather glass to the country people of the locality.

Avery Pump and Tube Well.

Complete for Use.

The TUBE WELL is formed by driving prepared iron piping into the ground with a sledge. Although of comparatively recent invention, these wells have won a world-wide reputation, and are proven to be superior to the ordinary dug well, costing sometimes less than one-fourth that of others, and at the same time excluding the surface water and dirt. The tubing is coupled together in lengths of about six feet, as they are being driven into the earth; the valves are then dropped in and the Pump screwed down on top.

FORCE AND LIFT PUMPS

Always on hand. For ease of Working, durability and force, the Avery Pump has no superior. For circulars, etc., address Postoffice box 17.

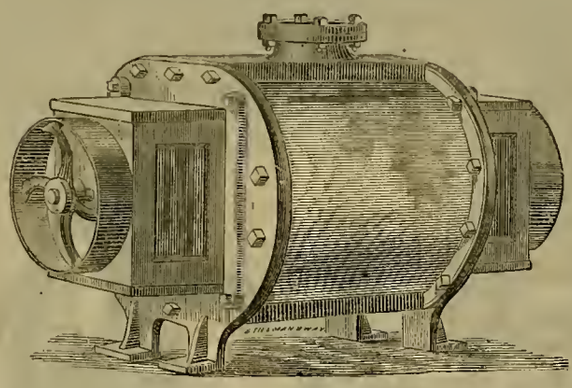
ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

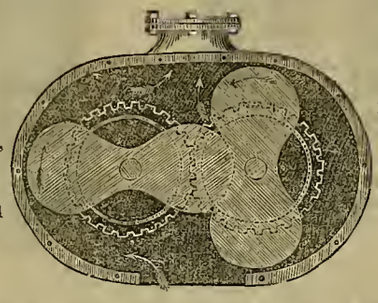
ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1854; July 21, 1856; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.



ADAPTED FOR Smelting, Foundry, Mining and Steamships.



REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

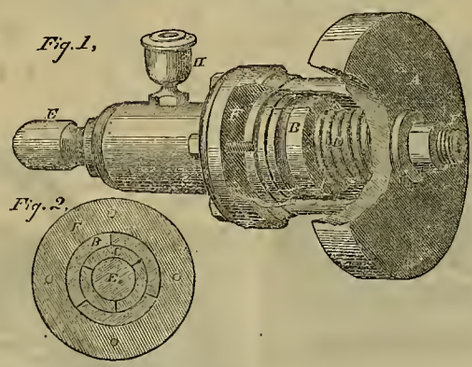
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

COLLIER & SILLIMAN'S
METALLIC PRESSURE PISTON ROD PACKING.



This invention relates to the packing used to render piston rods or propeller shafts steam and water tight, and has for its object the construction of a metallic packing, which shall be operated upon by gas, the vapor or liquid exerting the pressure, in such a manner as to form a perfectly tight joint. It also consists in so forming the gland of the stuffing box, that it shall serve as a support and guide for the rod and shaft, and at the same time afford great facility for lubrication.

Two small openings now connect the interior of the cage with the source of pressure—as the cylinder in an engine or pump, or the water outside of the ship if it is for a propeller shaft—so that the greater the pressure the closer are the rings forced against the rod and inner face of the gland. In any case the Packing is to be applied to a water or air pump, so that the pressure will come from the liquid or the gaseous substance, as the case may be. One of the most important uses of this Packing is in the stuffing boxes of propeller shafts, in which case the openings connect with the outside water, the pressure on the rings depending upon the depth to which the shaft is submerged. This device is simple, and not easily got out of repair; is perfectly efficacious and self-regulating, and in the case of shafts, especially, will do away with the great expense of repairing the derangements of the stuffing box which now so frequently occur. This new invention has already been adopted on the Central Pacific Railroad and by some of the principal Flouring Mills in San Francisco and Sacramento, and is growing at once into popular favor. A description of the engraving accompanying this will be found in the *Mining and Scientific Press* Jan. 9, 1869, and in the patentees' circular, which can be had free on application.

Certificates of Recommendation:

OFFICE C. P. R. R. CO. OF CAL., Sacramento, Nov. 24, 1868.—*To Whom it may Concern:*—This Company has made a thorough practical test of Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and accordingly recommend it to all others interested.
E. B. CROCKER, Gen. Agent C. P. R. R. Co.

THIS IS TO CERTIFY, that we have been using the Collier & Silliman's Patent Metallic Rod Packing, and find it a superior mode of packing to any other in use, and would recommend it to all others interested.
SETH H. GARFIELD, Prop. Pioneer Mills, Sac. City; WM. EICHELLS, Engineer.

For sale at the principal Machine shops and Foundries in San Francisco. Full particulars can be obtained by addressing ORRIN COLLIER, Sacramento, Cal., or E. B. SILLIMAN, Bridgeport, Ct.

Metallurgy.

MOSHEIMER'S
PIONEER MINING SCHOOL,
—AND—
METALLURGIC WORKS.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of

Chemistry, Assaying and Metallurgy,

That I am prepared to teach all the above branches in less time than in any European School.

I also undertake to assay and work any kind of ore, or mineral substances.

For terms, apply to JOS. MOSHEIMER,
Practical Chemist and Metallurgist.
Office, 328 Montgomery street; Metallurgic Works, 2005 Powell street, San Francisco. 6v18-6m

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.
BULLION MELTED AND ASSAYED.

The correctness of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner.

Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs Ploche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures, Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the Inventor and Patentee of the new and wonder ful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

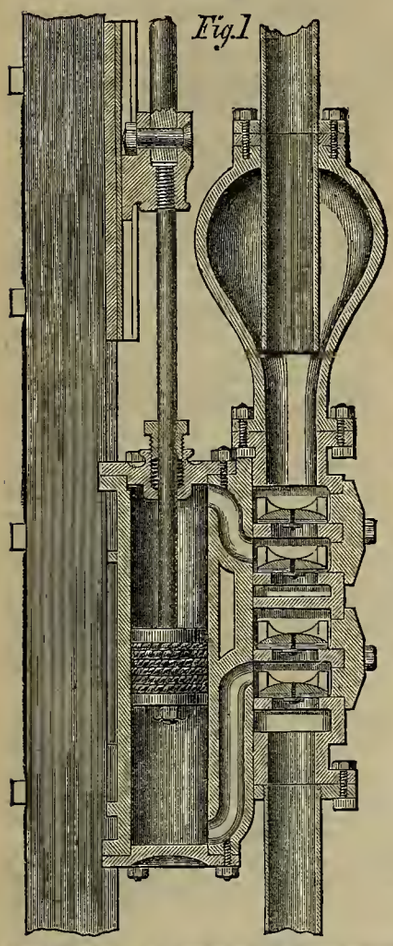
With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

THE EXCELSIOR PUMP.



THE BEST PUMP FOR MINING,
FARMING AND DOMESTIC PURPOSES.

Hooker's Patent, August 15, 1866; Jan. 15, 1867.

IMPROVED
DOUBLE-ACTING SUCTION AND FORCE PUMP.

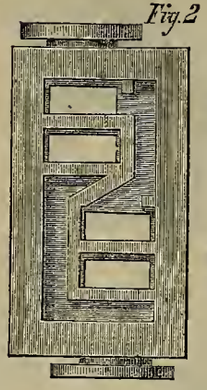


Fig. 3.

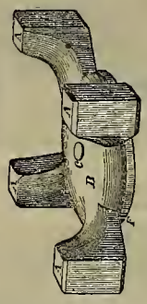

Fig. 4.

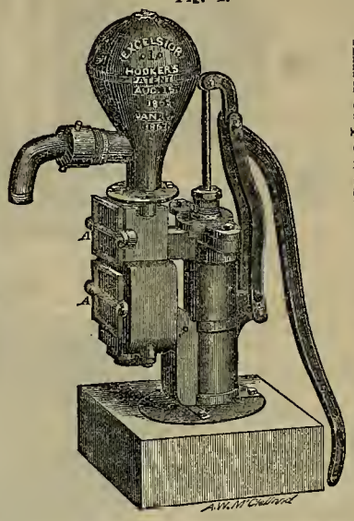
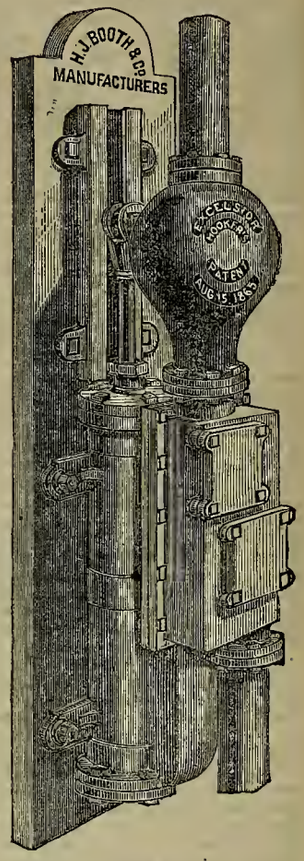


Seventeen different Styles and Sizes, suitable for all purposes, and for any kind of power.

Fig. 5.



These Pumps are meeting with universal favor wherever tried, and are now being introduced, in many instances superseding Pumps which had hitherto been considered the best in the world.

Fig. 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemp packing on the left, with the chamber on the right containing the puppet valves. Fig. 2 represents the chamber, with the water-passages and valve-seats. Fig. 3 is the valve, operating in the chamber. Fig. 4 is the improved Hand Pump. Fig. 5, a 6-inch Mining Pump, shows the adjustable bonnet opening to the valves.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO. Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, San Francisco, or

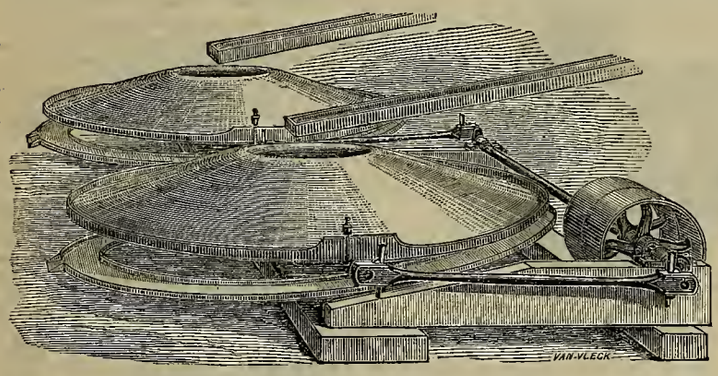
San Francisco.

JOHNSON'S
PATENT BATEA SEPARATOR AND AMALGAMATOR



For Separating Powdered Mercury, Gold and Silver from Sands and Sulphurets.

These machines are made of cast iron, five feet in diameter, and covered with sheet copper; they require but very little power, and no attendance or expense after set in motion. They are designed to receive the stream from a battery or from amalgamating pans. The movement will keep the sands and sulphurets loose and in constant motion from center to circumference. The powdered mercury containing gold or silver is, by the law of gravitation, precipitated to the bottom on the copper. The weight of the loose sand and water, together with the movement of the machine, will cause a gentle friction sufficient to concentrate the powdered mercury. When concentrated, the amalgam adheres to the copper, whilst the mercury flows on down to the recess in the rim, where it is confined, and the sands and sulphurets are allowed to discharge over the top of the rim all aronnd upon a circular apron terminating in a sluice. These machines are simple, new, novel, cheap and effective. Weight of a pair, with gearing, about 1,000 pounds.

Price, for a Single Machine, complete, - - - $300.
For a Pair, - 500.

Manufactured and for sale by

HOWLAND, ANGELL & CO.,
Miners' Foundry, San Francisco.

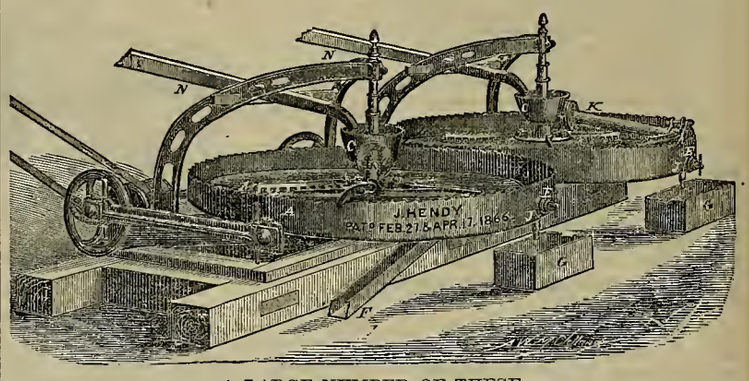
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.



A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

Mr. Hendy, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice. By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

Office of North Star Mine, Grass Valley, Nov. 12, 1868.

Joshua Hendy, Esq.—Dear Sir:—I take pleasure in certifying to the efficiency of the two last Concentrators ordered from you. We have run them steadily since July last, with but a very trifling expense for repairs. The additional length of step is a decided improvement. The first six sent to us have run steadily for nearly nine months, and are still doing good work. * * * The concentrations from the eight pans alone much more than pay our entire surface expenses. Without them we should lose a large proportion by any system of concentration now in use. The eight Concentrators receive the pulp from our 24 stamps, which are crushing 1,040 tons per month. Our sales of Sulphurets last month amounted to 70 tons, or nearly 7 per cent. of the mass crushed. The sulphurets from the reconcentration, contained about 10 per cent. sand. In addition to their properties as concentrators, they have done us good service as amalgamators, they having saved us the past month 50 ounces of hard amalgam, worth $350, which otherwise would have been lost.

Respectfully yours, J. H. CROSSMAN, Supt. N. S. Mine.

J. HENDY, Patentee.

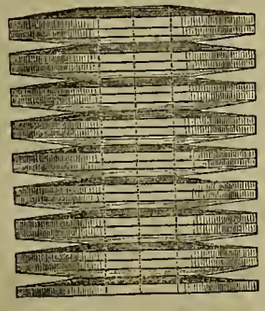
The Belleville Buffer Spring.

This invention shows a new method of taking advantage of the elasticity of steel for spring purposes. It consists in placing over each other a number of steel rings or disks of conical shape having a hole through the middle, always the convex side of one against the convex side of the next ring, and its concave side against the concave



side of the next, in such a manner as to form the pile shown in the engraving. The buffer is applied in the same manner precisely as the rubber buffer. The elasticity of steel applied in this manner, admits of considerable spring on the application of a weight from above; and the steel buffer is much more durable, not affected by heat, is less expensive, can be replaced, each ring or disk separately, in case of breakage, and is stronger than either the volute or the elliptic spring. The agent is S. L. Percira, No. 410 Montgomery street.

CHLORIDE WONDERS are set afloat by several of our Nevada cotemporaries, under date of April 1st. The *Enterprise* describes with some minuteness a mammoth tooth found imbedded in chloride of silver—which mammal, it appears, must have been of the carboniferous age. Though this strikes us as rather early to be out, for the *Enterprise's* lone beast, yet we are bound to coaccde that nothing is too wonderful for White Pine. The *Reveille*, and half a dozen soberer aiders and abettors, had a chunk of chloride journeying heavenwards in the fork of a tree, by whose rank growth it had been lifted from the prolific soil. It was before the 1st of April that little puddles of metallic silver were in the habit of being found where the Indians had been building their fires.

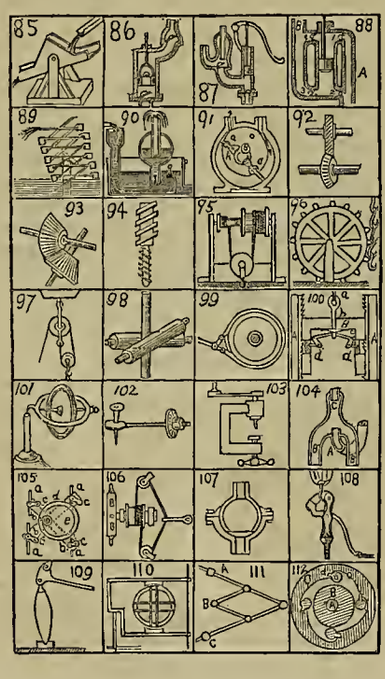
Mechanical Movements.

We continue (from page 113) our illustrations of mechanical movements:

85. Obtaining vibratory motion from a trough divided transversely at the middle, and supported on an axis. Has been used as a water meter.

86. Common lifting pump.

87. Force pump, with air-chamber to the outlet, to produce a constant flow. The cylinder is above water, and is fitted with solid piston. When piston is rising, suction-valve is open, and water rushes into cylinder, outlet-valve being closed. On descent of piston, suction-valve closes, and water is forced up through outlet-valve to any distance or elevation. The outlet from air-chamber is shown at two places, from either of which water may be taken. The air is compressed by the water during the downward stroke of the piston, and expands and presses out the water from the chamber during the up-stroke.



88. Double-acting pump.

89. Pendulums or swinging gutters for raising water.

90 Montgolfier's hydraulic ram. The right hand valve being kept open by a weight or spring, the current flowing through the pipe from left to right escapes thereby. When the pressure of the water current overcomes the weight of the right valve, the momentum o the whole column of water opens the other valve, and the water passes into the air-chamber. On equilibrium taking place, the left valve shuts and the right valve opens. By this alternate action of the valves, water is forced into the air-chamber at every stroke, and raised to a greater hight through the outlet-pipe.

91. One form of rotary pump or steam engine.

92. Transmitting motion from one shaft obliquely to another.

93. Similar to 92.

94. Micrometer screw, by which great power can be obtained.

95. Chinese windlass, embracing same principles as 94. The movement of the pulley in every revolution of the windlass is equal to half the difference between the larger and smaller circumferences of the windlass barrel.

96. Chain wheel, the cogs locking into the links of the chain on the right.

97. Hoisting blocks.

98. Longitudinal and rotary motion of the rod is produced by its arrangement between two rotating rollers, the axles of which are oblique to each other.

99. A brake used in cranes and hoisting machines. By pulling down the end of the lever, the ends of the brake-strap are drawn toward each other, and the strap tightened on the brake-wheel.

100. Otis's safety stop. The weight of the platform and the tension of the rope keep the pawls out of gear from the ratchets in hoisting or lowering the platform, but in case of the breakage of rope the spring, c, presses down the pin, b, and the attached ends of the levers, and so presses the pawls into the ratchets and stops the descent of the platform.

101. The gyroscope. If the disk is set in rapid rotary motion on its axis, and the pintle at one side of the ring, is placed on the bearing in the top of the pillar, the disk and ring seem indifferent to gravity, and instead of dropping begin to revolve about the vertical axis.

102. Helicograph. The small wheel moves along the screw as it revolves about the central point, and describes a spiral,

103. Portable cramp drill. The feed-screw is opposite the drill.

104. Steam siphon pump. Jet of steam enters through and into C, and expels the air from C, forming a vacuum, thus causing the water to rise through B, B.

105. One form of feathering paddle-wheels.

106. Ordinary steering apparatus. By turning the wheel, one end of the rope is wound on the barrel and the other let off, and the tiller is moved in one or the other direction, according to the direction in which the wheel is turned.

107. Ball and socket joint for hydraulic pipe or tubing.

108. Boat-detaching hook. A rope attached to the lower end of each lever is pulled in such a direction as to slip the eye at the upper end of the lever from off the tongue, which being then liberated slips out of the hook of the tackle and detaches the boat.

109. A knee-lever. Great force is obtained by raising or elevating the horizontal lever.

110. Shoe and lever brake.

111. Pantagraph for copying, enlarging and reducing plans, etc. C, fixed point. B, ivory tracing point. A, pencil trace, the lines to be copied with, and B, the pencil, will re-produce it double size. Shift the slide to which C is attached, also the pencil slide, and size of the copy will be varied.

112. Johnson's friction clutch. The outer hand or rim revolves freely when moved to the right, but when turned to the left the four rollers play instantly back into the narrow portions of the recess, and bind the rim fast to the journal or center piece.

We shall soon issue this series of Mechanical Movements in full,—together with much other valuable information for inventors,—in pamphlet form, copies of which will be furnished free on application, or sent to order by mail.

CROSS' COMBINED HEATER AND SEDIMENT COLLECTOR.—The royalty on this invention—to render more advantageous in boilers the use of salt or muddy water, and more fully described in the MINING AND SCIENTIFIC PRESS at the time of its invention, about a year ago,—has been reduced 45 per cent., as will be seen by Mr. Cross' advertisement in another column, enabling the manufacturers to furnish them at greatly reduced prices. Two of these heaters are being built for the California Steam Navigation Company, containing 80 2-inch brass tubes. Each of these tubes were imported from the East expressly for this purpose. We are informed by Messrs. Williams, Root & Neilson, of the Union Foundry, Sacramento, that they have made these feeders with most of the engines manufactured by them during the past two years, and that they have invariably given the best of satisfaction. The principle employed is simply that the exhaust steam traverses the length of the heater surrounding the water tubes, and thoroughly heats the water before its admission to the boiler. The gradual circulation of the water through the cluster of pipes favors the deposition of the sediment mechanically suspended in it, which can be readily removed by "blowing out" the water from the boiler.

"M. E.," a San Francisco correspondent of the *London Mining Journal*, exposes the forgery of a letter in that journal signed with the name of Joseph Organ, a Cornish miner residing in Humboldt county, Nev., with a view to enhancing the stock value of certain mining property in the market. The same correspondent continues: "I am justified in saying that ten square miles about the Caru Brea Hill, in Corowall, have produced more mineral profits than all this State (Nev.) will do from its mountain veins in 80,000 square miles of country, during the present generation." The Carn Brea has excelleut mines of tin and copper; it is a fine old heath-covered hill, traced with druidical circles half hidden in shrubbery, overlooking a peaceful, ancient ocean; and it is all in the blessed "old country." But every intelligent reader of the *Mining Journal* of course knows the above to be ridiculous. If any old country conservative capitalists should be induced thereby to tighten their grasp on the share they hold in the world's money power, contentedly, at from three to five per cent. per annum, Nevada can afford it. Correct intelligence will, however, in all cases produce the proper effect.

HUMBOLDT.—A monument is to be erected to Humboldt, in the New York Central Park. The centennial anniversary of his birthday will occur on September 14th next, and will be celebrated in connection with the erection of the monument.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

On Amalgamation of Silver Ores Without Roasting.

CHAS. H. AARON.

The effects ascribed to the action of electricity in Nolf's process, and in Mr. Scott's experiments, as described in his recent letter to the PRESS, can, in very many cases, be obtained as well, practically, without electricity as with it.

In the fall of 1867, I bought from the Silver Sprout Company, of Kearsarge District, a ton of their ore, which was part of a lot of five tons of crushed ore then lying in the mill, and which, by common pan process, yielded only $50 or $60 at most per ton. I took this ore to an arastra, and ground it to a fine pulp with water; then heated the pulp in an iron pan, and transferred it boiling hot to a wooden barrel. I then added a little salt, some scraps of copper, mercury, and one per cent. by weight of cuprie sulphate. The result, after twelve hours working in the barrel, was $106.43 in silver, and $13.42 in gold. The assay of this ore was not made very exactly, for want of necessary means, but was about $140 per ton in silver. I next worked, in the same way, 300 pounds of ore from the Cerro Gordo, and it yielded at the rate of $104.26 per ton, the fire assay giving $145 per ton. I afterward tried to work the same kind of ore in iron pans, and got only 60 per cent. of the fire assay, and *very* poor hullion. The hullion from the barrel was over .900 fine.

Mr. J. B. Low, then superintendent of the Kearsarge mine, having consulted me as to the best method of working his ore, in which he did not at first succeed, I advised him, as the best he could do under the circumstances, to "pickle" it with salt and bluestone in the vats, before putting it into the pans. He did so, using six pounds of bluestone to the ton, and steaming the mass by means of a hose and nozzle. Some forty tons were thus treated, which, when worked in the pans, gave $120 per ton, while that worked without "pickling" yielded but $72 per ton. The bullion, as was expected from iron pans, was very low, as the ore contained lead. I caused samples of ore from Hot Springs, in Mono County, to be sent to me, which ores have been pronounced "very rebellious," but which I find "truly loyal," at least very docile. I made the following experiments:

One thousand grains of the Diana ore, amalgamated in a porcelain-lined iron dish, with five per cent. of ferro-sulphate, and a like quantity of salt, and stirred with a copper spoon, yielded at the rate of $513 in silver, and $15 in gold per ton. The tailings, carefully saved with all the water, and dried, retained $25 per ton. The yield was therefore 95 per cent.; 1,000 grains of Comanche ore from the same district gave $538 per ton.

I also got samples of common mill ore from Virginia and Gold Hill. Of the latter, just as it came from the battery, and without further grinding, ten ounces were worked as before with a copper spoon, in a porcelain-lined dish, with two per cent. of salt, and one-fourth of one per cent. of bluestone, and yielded at the rate of $18.16 silver, and $5 gold per ton. This ore assayed $20.50 per ton in silver, and the tailings retained $3 per ton.

A piece of rich ore from the Comstock vein, treated similarly with three per cent. of bluestone and salt, gave readily $798 silver, and $591 gold per ton; the tailings retaining $80 per ton silver, and a little gold.

Ore from the Belmont mine, Cerro Gordo, treated with ten per cent. cuprie sulphate, and salt, gave 88 per cent. of fire assay.

Another sample from the same, assaying $330 per ton, treated with 7½ per cent. ferrie sulphate, and, of course, some salt, gave $316 per ton.

I made many experiments to reconcile the use of cuprie chloride with that of iron pans, by means of an ammoniacal solution; but, whether with iron or copper as a precipitant, could not get more than half the silver.

The substitution of ferro-sulphate for cuprie sulphate, in some of these experiments, may require explanation. It amounts, in fact, to the same thing; as in all those cases the ore itself contained cuprie oxide, or carbonate; and the reaction of ferrie chloride (ferro-sulphate and salt) produced cuprie and cupreous chlorides, which are the active agents in this process, according to the equation $2FeCl+3CuO=CuCl+Cu2Cl+Fe^2O$, or, in case of the carbonate, a similar reaction with evolution of CO^2.

In these cases of ores containing cuprie oxide or carbonate, there are various ways of producing the cupreous chloride, as well as the metallic copper required, which will readily suggest themselves to the properly qualified millman.

The reaction of ferro-chloride on cuprie oxide, with a similar one which takes place with ferro-chloride and plombic oxide, and again, with cuprie chloride and argentic oxide, led me to hope that the general law might be deduced therefrom, that, when a metal can be precipitated from a given solution by another metal, the oxide of the first would decompose a similar solution of the second; but experiment does not sustain this idea, for, though lead and zinc precipitate copper from the solution of its chlorides, yet the cuprie oxide does not decompose the solutions of the chlorides of lead or zinc: on the contrary, the plombic oxide, at least, decomposes both cuprie and cupreous, as well as ferro-chlorides in solution.

This is the reason why the Cerro Gordo ores, containing plombic oxide or carbonate, require so large a quantity of chemicals in this process, as compared with those of Virginia. These reactions are controlled by what I shall call the *balance of affinities.*

The artificially made argentic sulphide is acted on by both cuprie and cupreous chloride, either hot or cold, forming argentic chloride, which, in presence of copper, is reduced to silver; with reproduction of cupreous chloride; and this constant reproduction of the required reagent is the key to economy in this process, which, however, is not a new process, being identical in principle, and almost so in practice, with the Mexican process called "beneficio de fondo," in which the ore is amalgamated in a copper bottomed pot or pan, with "magistral" or bluestone and salt.

Many other compounds of silver, as well as the sulphide, are acted on by the cuprie chlorides, and, to a greater or less extent, by ferro, plombic and ammonia chlorides; but none of these approach the chlorides of copper in efficacy.

The ammoniacal solution of copper with salt, acts on argentic oxide and carbonate; but not on the sulphide.

The inference justly deducible from my experiments, seems to vindicate the assertion I made some time since, in your columns, that "the best process for amalgamating the ores of this valley, and of the Comstock vein, as well as many others, is nowhere in use in this country."

Californians have depended too much on "improved pans," and have attempted to do by brute force, that which must be done by the gentle persuasion of chemical affinity.

To those who believe that the salvation of gold and silver lies solely in pans; to those happily growing fewer every day, who still hug the delusion that "practical" knowledge which too often means stupid ignorance, is all a millman needs, and that scientific information is only fit for the laboratory chemist, I say ponder on the millions of treasure lying buried in the sink of the Carson, simply because our millmen did not know that the reactions of the "patio" or of the "fondo" could not be obtained in iron pans, but could in suitable vessels!

Let iron pans do their proper work of grinding if you will, for, as the Mexicans say, "mercury has no teeth;" but for amalgamators, at least for wet amalgamation, give us steam-heated wooden barrels or tubs, for pans of Ransome's stone, which can be made wherever they are wanted, and repaired with a bag of sand and a couple of bottles of solutions, instead of costly bolts and castings. Then, with copper as reducing agent, we shall hear no more of "iron amalgam," base metal, and such stuff.

The reduction of the ores by copper instead of iron, will give fine bullion always, and in most of our mines it can be had cheaper than pan castings. In many cases the ore itself will furnish it. Iron sponge can be made cheaply almost anywhere, and with that and a cupreous ore, we have all the copper we want.

[Written for the Mining and Scientific Press]

A New Method for Treating Sulphureted Ores.

A new method for treating ores, invented by Dr. Charles D. Williams, of St. Paul, Minnesota, in which the operation of desulphurizing and chloridizing such ores is performed simultaneously with the roasting of the same, has recently been experimented upon in a practical way in Colorado, and has demonstrated beyond a question of doubt, its entire success and utility in working sulphureted gold and silver ores. The *modus operandi* of this method is very simple, and without doubt will come into general use at an early day. The furnace in which the ores are treated is constructed on the reverberatory plan, and is built with ordinary brick, provided with a grate in the usual manner. It is erected upon a suitable foundation, and consists of two parallel vertical walls, which terminate in an arch at the top, the end inclosing walls being of the same material as of the sides, viz., ordinary brick. From the fire-box to the rear of the furnace are partition walls running parallel to the side walls, and which divide the passage for the products of combustion into three distinct flues, and they also serve as supports for the sole or hearth upon which the ores rest while being roasted. The flues or passages from the fire-box to the rear end of the hearth through which the heated products of combustion, arising from the fuel on the grate, pass, serve the purpose of heating the lower portion of the ores on the hearth. These flues at the rear end unite with a short vertical flue through which the heat ascends to the chamber containing the ore, where it is further utilized in heating the upper surface of the ore, and from the front end escapes through a pipe to the atmosphere. The plate comprising the bottom of the chamber rests upon a projection formed in the side walls of the furnace. Its lower surface is exposed to the action of the fire, while its upper surface is covered with soapstone, which serves the purpose of preventing injury to the metal, consequent upon the presence of the sulphur which is found in the ore. The metal arch comprising the roof of said chamber is also protected by soapstone blocks for a distance, vertically, of six inches, or as far up its sides as the ore may extend. In the top of the arch is a hole about five inches in diameter, through which the ore is fed to the desulphurizing chamber. At each end of the ore chamber doors are placed for the purpose of inserting a rod or shovel for agitating the ores during the operation of desulphurizing and chloridizing. At the side of this furnace is constructed a small furnace provided with a grate and doors for the insertion of fuel and removal of ashes. This furnace is divided into two compartments by means of an iron plate, the lower partition forming the fire-box, and the upper the chamber, in which chlorine gas is generated for use. The upper chamber is provided with a door through which is inserted a cup or basin of sufficient capacity to receive the gas generating vessel. This cup is filled partially with water, for the purpose of forming a bath for a glass vessel in which the chlorine gas is generated; said vessel is placed within the cup or basin, and is provided with an aperture in its top for the insertion of the materials from which the gas is generated, which aperture is provided with a stopper which screws tightly therein, so as to prevent the possibility of leakage. It is also provided with a pipe which is secured to its upper surface, and which communicates directly with the ore chamber in the first mentioned furnace, and is for the purpose of conducting gas generated in said vessel to said chamber. In the rear of the roasting chamber is a trough or chute for the purpose of conveying the contents of the chamber to an iron box or car.

THE OPERATION.

The furnace having been constructed as above described, the ore to be treated is passed through the aperture in the top of the ore chamber, and is evenly distributed over the sole or hearth. When the fire is kindled in the roasting furnace, and as the heated gases pass to the rear, they impinge against the bottom plate of the sole, thus imparting a portion of their heat to the lower portion of the ore. They then pass through the vertical flue at the rear of the chamber, and into the space in said chamber above the ore, and to the outlet in the front end or top of said chamber, thus imparting the remaining portion of the heat, or a large portion thereof, to the upper surface of the ore upon the hearth. Simultaneously with the kindling of the fire in the furnace, a fire is lighted in the gas generating furnace, in order that so soon as the ore commences to be heated, a stream of chlorine gas generated from muriatic acid and manganese, also sulphuric acid, (materials contained in the generator) shall commence passing into the space in the chamber, thus envolving the upper surface and filling the interstices between the parts or particles of ore upon the hearth. It being a well-known fact that chlorine gas is heavier than the products of combustion which arise from burning fuel, or the vapors which arise from the ore, while being roasted or treated in the furnace, it follows, as a consequence, the gas will remain in intimate contact with the ore upon the hearth, while the vapor from such ore, and gases from the fuel will be compelled to rise through a much heavier and more dense medium, and it is believed that, as a consequence, a very large portion, if not all the particles of metal which usually pass off with the vapor or fumes of the ore, will be arrested by the enveloping or intervening strata of gas, and be retained and mingled with the ore in the form of chlorides.

When the ore is desulphurized it is drawn from the furnace and put into barrel amalgamators, when water is introduced, which places the chloride of gold into a solution. A solution of the sulphate of iron is then introduced to precipitate the gold, and metallic iron is introduced to precipitate the silver and copper, if any. These chemicals thus introduced with the ore, are agitated by the barrel being set in motion and allowed to run for three hours; at the end of that time quicksilver is introduced, the barrel again set in motion and allowed to run six to eight hours, when it is washed out, retorted, and placed into a merchantable shape.

Parties wishing to learn more of this method are referred to Mr. M. R. Jefferds, of the North American Bureau of Mines, Chicago, Illinois. QUILP.

ALONG THE RAILROAD.—From W. H. M. we obtain the following notes:

At Truckee—a lively place—only Ellen's and Schaffer's sawmills were running last week, the rest having been at a standstill, at the time, on account of the heavy snows, which were from four to six feet deep at the summit. New buildings were still going up. The Railroad Company's roundhouse at Truckee, which burned down a short time ago, was a loss of $40,000; but the re-building is rapidly in progress.

At Wadsworth, building is likewise active; the Railroad Company are putting up a semi-circular round-house capable of holding twenty engines, a fine machine shop and blacksmith shop, all of which are to be completed in three months. The company is selling or renting lots here at good prices. Ties and other materials are seen flowing in a constant stream to the front, smoothly and systematically.

At Hot Springs, on the Humboldt Desert, the company has five men with a 12-horse-power engine employed boring for pure water, for the engines. They are down 612 feet, and have yet struck nothing; but Mr. T. G. McLeran, the superintendent, thinks, from the kind of clay brought up, that the prospects are good. Water in this desert would be a "big thing." The hot springs are a mile from the station; near them the sand is turned into stone. The water is very clear, and is used by the hands to wash their clothes in.

"White Cloud District," opposite Hot Springs Station, in Churchill County, thirty miles from Oreana Station, is receiving attention from some Santa Clara and San Francisco gentlemen just now; the White Cloud ledge being three to four feet in width, running east and west, and assaying in the hundreds. There are no houses within thirty miles. The Utica 10-stamp mill, owned by a large New York Company, is about thirty miles distant, situated two miles from the railroad. It is driven by water obtained from Humboldt Lake, which is controlled by the New York Company, and is twenty-five miles distant by the race. Their dam having "busted," the mill has been standing still for a few weeks. Ore is obtained from the mountain ranges near by.

Mechanical.

Belting.

We condense the following from "Belting Facts and Figures" in the *Journal of the Franklin Institute:*

"Pulleys covered with leather, with grain-side of band to pulley, will sustain *50 per cent. more resistance* than without the pulley being covered. Leather belts, grain-side to pulley, will drive 34 per cent. more than flesh-side to pulley; 48 per cent. more than rubber; 121 per cent. more than gutta percha; 180 per cent. more than canvas; consequently, the very best arrangement for belting is to use it with grain-side to pulley, and have the pulley covered with leather. The next best pulley is polished iron, especially for quick motions. Polished wood is next, and rough iron least, in value.

Leather, used with grain-side to pulley, will not only do more work, but last longer than if used with flesh to same. The fiber of the grain-side is more compact and fixed than that of the flesh, and more of its surface is constantly brought into contact with, or impinges on, the particles of the pulley. The two surfaces, that of the band and that of the pulley, should be made as smooth as possible: the more so the greater the contact surface, and the more the particles of each impinge on the other. The smoother the two surfaces, the less air will pass under the band, and between it and the pulley—the air preventing the contact of band with pulley—the greater this contact, the more machinery will the band drive. The more uneven the surface of band and pulley, the more strain will be necessary to prevent bands from slipping. What is lost by want of contact, must be made up by extra strain on the band, in order to make it drive the machinery required—oftentimes, if the band is laced, causing the lacings to break, the holes to tear out, or fastenings of whatever kind to give way.

Rubber, gutta percha, and canvas are the dearest articles to use for bands. Under the same circumstances, these will not last one-fourth as long as leather. When once they begin to give out, it is next to impossible to repair them. Wide bands cannot be used for or cut up into narrow ones, as leather can be. Leather belts may be used over and over again, and, when of no further value for belts, can be sold for other purposes. A rubber band, costing hundreds of dollars, may be spoiled in a few moments, by the lacing giving out, and the band being run off into the gearing, or by being caught in any manner so as to damage the edge, or by stoppage of either the driving or driven pulley. A few moments of quick motion or friction will roll off the gum from the canvas in such quantities as to spoil the hand. Leather belts may be torn or damaged, yet are easily repaired. It is otherwise with rubber. Rubber, gutta percha, and canvas belts will continue to stretch as long as in use, rendering it necessary to shorten them continually. Gum belts will not answer for 'cross' or 'half-cross' belts, for 'shifting' belts, 'cone pulleys,' or for any place where belts are liable to slip, as friction destroys them. A well-made leather band, if properly looked after, will last 12, 15 or 20 years, and yet be of value to work over into narrow belts."

Won't Wear Out.—M. Cazeau says that aluminum bronze,—which is an alloy of copper and aluminum containing eight to ten per cent. of the latter metal,—makes a covering to stair cases which, in a certain instance cited, was as good as new, after eleven months wear; while a previous covering of common bronze, of four times the thickness, upon the same stairs, was worn out in six weeks.

Glycerine.—As a lubricator for fine and delicate mechanisms, such as clocks, chronometers, etc., glycerine is found superior to the best waluut oil, and mixed with plumbago or some other material, to give it due consistency, may yet prove of value for the same purpose on heavier journals. *Artisan.*

Piston Packing.—McClintock's Patent Metallic Packing consists of rings made of alternate layers of linen and india-rubber cement, the whole being compressed in a powerful apparatus. The inner side of the ring has a thin copper lining, held firm in its place by claws, which double over and into the linen. The rings are dense, elastic, and possess all the qualities of good packing.—*London Mining Journal, Jan.* 30.

Cameron's Blowing Engine.—This new engine is expected to completely revolutionize that class of machinery. The Pittsburg *Commercial* says: "It is a well-understood fact that, in a steam engine, while the fly-wheel is making a uniform motion, the piston is irregular in its motion, moving rapidly in the middle of its stroke, and slow towards the ends. For driving revolving machinery, it is necessary that the engine shaft and fly-wheel should revolve uniformly, because they communicate the motion; but in a blowing engine, where the duty is taken directly from the *piston*, and where the fly-wheel gives the piston an irregular motion—accelerating it when it should be retarded, and retarding it when it should be accelerated—the absence of a fly-wheel is a necessary condition to a uniform blast. Taking advantage of this fact, Mr. Cameron dispenses with the fly-wheel and all its attendant paraphernalia. And the great advantage of this can be understood when we say that in the average of blowing engines there is enough of material in the fly-wheel alone to construct an engine from, on Mr. Cameron's principle, equal in capacity to the engine of which the fly-wheel only forms a part."

Double Bogies.—"An engine of this class has 12 wheels, 4 feet in diameter, arranged in two groups, each independent of the other, and driven by a pair of cylinders 18 inches in diameter, with 24-inch stroke. The fuel and water are carried on the engine, and the whole weight made available for grip on the rails. The bogies are free to swivel on their pins, and each can radiate independently of the other. The boiler has two barrels, each 13 feet long by 4 feet in diameter, and has altogether a total heating surface of 2,550 square feet. The tractive power of the engines, with a cylinder pressure of 100 pounds to the square inch, is equal to 33,400 pounds, equivalent to drawing a gross load of 390 tons up a grade of 200 feet to the mile, at a speed of 10 miles an hour. One of these engines is to be tried on the Central Pacific Railway."—*Am. Artisan.*

Boiler Deposits—A Few Hints.—The deposition of the carbonate of lime can be prevented by dissolving sal-ammoniac in the water; for that salt and the carbonate of lime are mutually decomposed, producing carbonate of ammonia and chloride of calcium, of which both are soluble in water, and the former is volatile. The deposition of sulphate of lime can be prevented by dissolving carbonate of soda in the water; the products being sulphate of soda and carbonate of lime, of which the former is soluble and the latter falls down in grains and does not adhere to the boiler.

The locomotive superintendent of the Chicago and Northwestern Railroad has succeeded in keeping the boilers under his charge free from scale by merely introducing, once in about three months, twelve pounds of pure zinc, in pieces weighing not more than one-half an ounce. The zinc wholly dissolves in from three to five months, and the inner surfaces of the boiler plates are then found covered with a thin coating of zinc.—*Am. Artisan.*

Heavy Modern Machinery.—A mass of metal of a ton weight was unknown before the Christian Era. Now those in cast iron up to 150 tons, in wrought iron to 40 tons, and in steel or bronze to 25 tons, are made in any desired form, and turned or bored with the most perfect accuracy. Two years ago I saw the largest lathe in England, which swings 22 feet, and will take in a shaft 45 feet long. Six months ago I saw one in this country which swings 30 feet, and will take in a shaft of 50 feet. There are planers which will plane iron 50 feet in length; others of 18 feet in width; others of 14 feet in hight, taking off metal shavings of two and a half inches in width and a quarter thick."—*Hon. W. J. McAlpine.*

Effect of Heating upon the Strength of Metals.—Sudden cooling from a high temperature tends to make most substances hard, stiff, and brittle; gradual cooling tends to make them soft and tough; and if often repeated or performed slowly from a very high temperature, to weaken them. Up to and beyond the fourteenth melting the resistance of cast iron to crushing increases; but the resistance to cross breaking reaches its maximum about the twelfth melting, and afterwards diminishes, from the metal becoming brittle and crystalline.

Welding Powder.—A composition recently patented in Belgium, is said to consist of 1,000 parts of iron filings, 500 parts of borax, 50 parts of balsam of copaiva or other resinous oil, with 75 parts of sal ammoniac. These ingredients are well mixed together, heated and pulverized.

Scientific Miscellany.

Ultra-Marine.

This beautiful blue pigment was originally prepared by simply pulverizing the mineral *lapis lazuli*, or sapphire, and was enormously expensive. It is now made artificially in large quantities; and what would have cost Raphael a thousand dollars, can now be purchased for a dime. It is now extensively used in the arts and manufactures. Prof. Charles A. Joy gives, in the March number of the *Journal of Applied Chemistry*, a description of this manufacture, and a history of its origin. In 1814, Tassaert, a French chemist, chanced to see a blue slag in the furnaces of a looking-glass factory. Upon analysis, its composition was found to be similar to that of the mineral aforesaid. Divers experiments were made at intervals from that time, by different chemists; and in 1822 Professor Gmelin, of Tubingen, succeeded in preparing a small quantity before the blow-pipe. In 1834 the process was tried on a manufacturing scale; in 1838, the Nuremburg Ultra-Marine Manufactory was founded. This is still the largest in existence, turning out more than two millions of pounds yearly. There are now in operation, in Europe, forty factories, which make, in the aggregate, some twenty million pounds yearly. The method of Prof. Gmelin is still, in all its essentials, the one employed; the different establishments, however,—each after its own fashion, which it keeps secret,—modifying this. It is as follows:
